Informance System Overview

The Informance Plant Solution – Discrete Edition is a suite of products focusing on performance tracking of discrete applications within a plant. The System Administration service is one of several modules that make up the overall solution. It provides access to all of the basic system settings and lists that drive operator entry and plant reporting.

The System Administration service is web-based allowing configuration of the Informance system throughout the plant and the enterprise. It includes a standard user / role / privilege scheme that provides security and limits access to sensitive features if needed.

What is in this User Guide?

This guide begins by covering the basics of System Administration – Logging in, Hub and Plant features and the Administrative Environment. It introduces you to the core concepts of System Administration and the basic navigation of the application.

The second chapter discusses Hub Administration which includes features affecting all plants within your Informance system. You will use the Hub features primarily to manage the list of reporting and admin users and their levels of access within the Informance applications.

The next chapter, Plant Administration, covers the most heavily used portion of the System Administration service. These are the features that allow you to edit the lists of downtime reasons, defect reasons, products, etc for every asset within a plant.

Configuration Features

As you review the chapters on Hub and Plant Administration, you will find that both of these sections close with a review of *Configuration Features*. Configuration Features represent additional tabs within the System Administration site that are used during initial setup and installation of Informance, but are not exposed for general customer access. These include features such as New Plant and New Asset creation and the definition of new Tagging Fields and new Reason Sets.

These settings tend to be fixed after installation and can cause significant system errors if they are improperly adjusted. In order to protect the integrity of your Informance system, these features are typically suppressed for the customer. Similarly, you will find that this user guide provides awareness of these features but does not give any detailed instruction on their use.

System Administration Basics

Logging In

The first step in accessing the System Administration service is logging in to your Administration Web Site. To log in, you must first obtain the following information from your Informance system owner.

- The URL or web address for your Informance Log In screen
- The unique username that has been setup for you in the system
- The password that has been setup for you in the system

Tip. If your site has implemented the web **Single Sign On** feature of System Administration, then logging in will be handled automatically. Single Sign on passes your credentials from the Windows Domain to Informance and authenticates your access with that information. Therefore, you will bypass the login screen and be taken directly into the application.

Once you have this information, open Internet Explorer and navigate to the address you were provided for logging in. The following screen will appear:

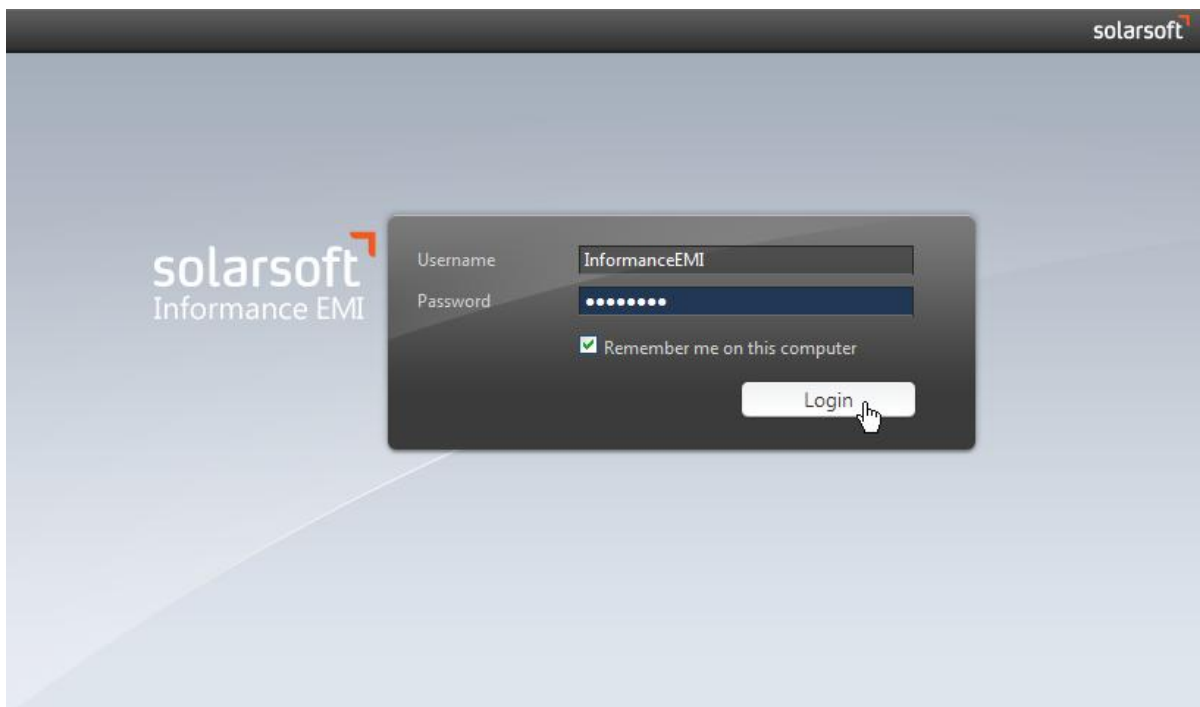

Figure 1: Informance Logon Screen

Enter your Username and Password in the boxes provided and click the **Log In** button. If your entries match a valid user profile in the system, you will be taken to the Plant Selection page. Your plant list will include the Hub as well as each plant in your system. Select one and click the **GO** button to enter the System Administration site.

Tip. If your access has been limited to only the Hub or a specific Plant, then you will bypass the Plant Selection page and be taken directly into the System Administration site.

If you are the only Informance user that will access System Administration from a specific computer, you can check the box labeled **Remember Me on this Computer**. If this box is checked and your username and password are approved, they will be saved as the default profile for this computer. On subsequent logins, you will bypass this screen and be taken directly to the Plant Selection page.

Tip. If you wish to 'undo' the Remember Me on this Computer setting to allow the log in screen to appear, you must delete the cookie for this site. Within Internet Explorer, cookies can be deleted by selecting 'Internet Options' from the 'Tools' drop-down menu. Under the 'General' tab of 'Internet Options' you will find a button labeled 'Delete Cookies'.

Hub vs. Plant Administration

There are two primary areas of system administration: Hub and Plant. Hub administration covers those settings that are global to all plants in the system. For the customer, these features focus on management of the system users that can access Plant Reporting and System Administration. At the Hub you will be able to create new system logins, set their passwords and assign each user a role that determines their level of access within the software. The configuration features for the Hub include the definition of system databases and the creation of additional fields.

Plant administration focuses on those settings that are specific to each plant. This primarily involves the management of all tagging sets (Downtime Reasons, Products, etc). When selecting a plant, you will be provided an interface to add, edit or delete any entry in the tagging sets for that plant. The configuration features for the Plant include the definition of new assets and new tagging sets as well as the management of the Super Reason list and all shift schedules.

If you have access to the Hub and one or more plants within your Informance system, you will be prompted to select from this list after logging in to *System Administration*. If your login has access to the Hub, it will be the first selection in the drop-down list, followed by each plant that your login can access. If your access has been limited to a single plant or the hub only, you will bypass this selection and be taken directly to that administration interface.

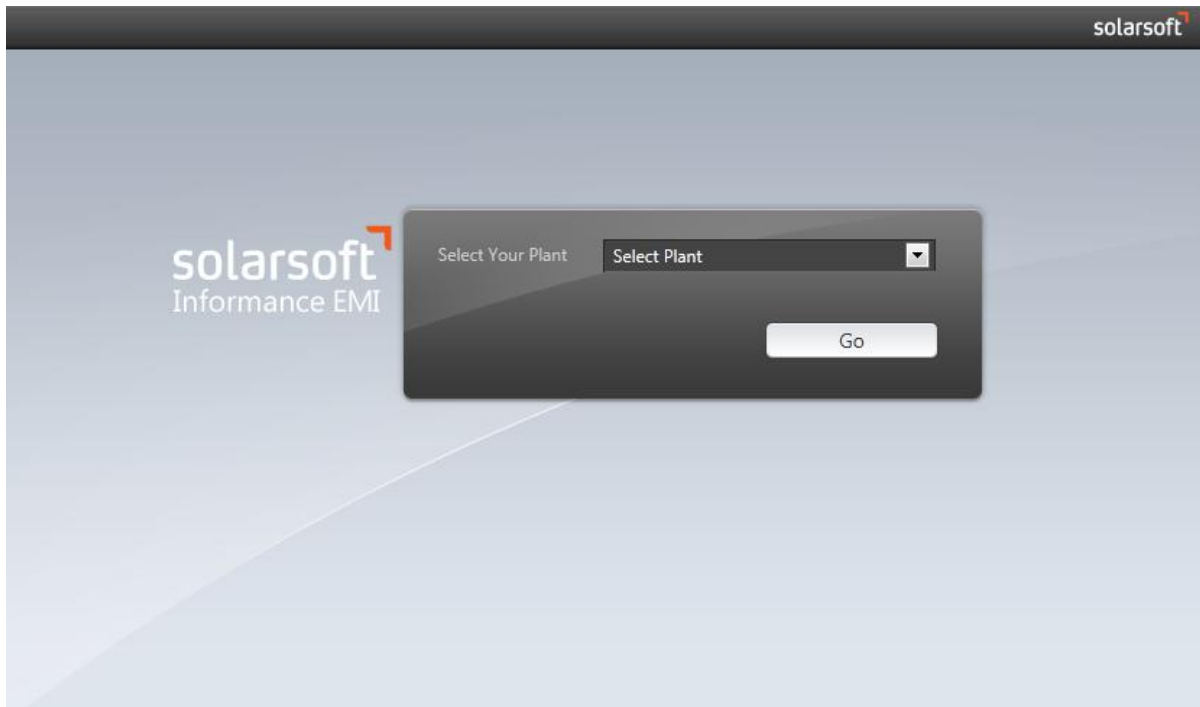

Figure 2: Informance Plant Selection

The Administration Environment

The *System Administration* interface has a similar look and feel to the other Informance application components. Features are organized into tabs and you can navigate the interface by clicking on any option in the navigation panel to bring its tab to the foreground. The active tab can always be identified as it will have a dark blue background and the tab title will be at the top of the page. The remaining inactive tabs will be light gray with the tab titles listed in normal text.

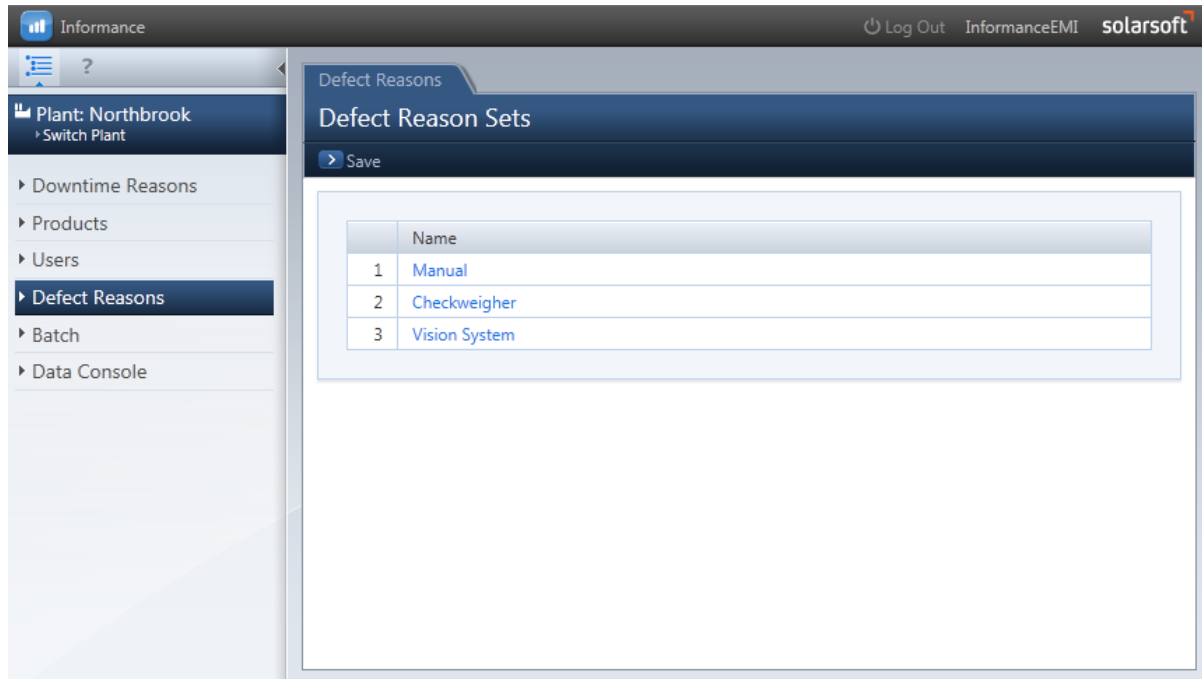

Figure 3: Administrative Interface when the Defect Reasons Tab is Active

Administration Tabs

Within each tab, the presentation of tagging sets and the various tools to manage that set is fairly consistent. You will find a *Bread Crumb* above the currently displayed list which indicates your current level in a set. Some lists are flat but others like the downtime and defect reasons are multi-level hierarchies, so the bread crumb is an important reference as you drill into any set. Each segment in the bread crumb is clickable as a way of navigating back to that level in the hierarchy.

The *Save* and *New* buttons are common to all tabs. You will always find these located in the upper left corner above the displayed list of entries.

The far right column labeled *Actions* will contain *Edit* (🔗) and *Delete* (✖) buttons for each entry.

Remember that edits and deletions are not permanent until you click the *Save* button (➤ Save) in the upper left corner.

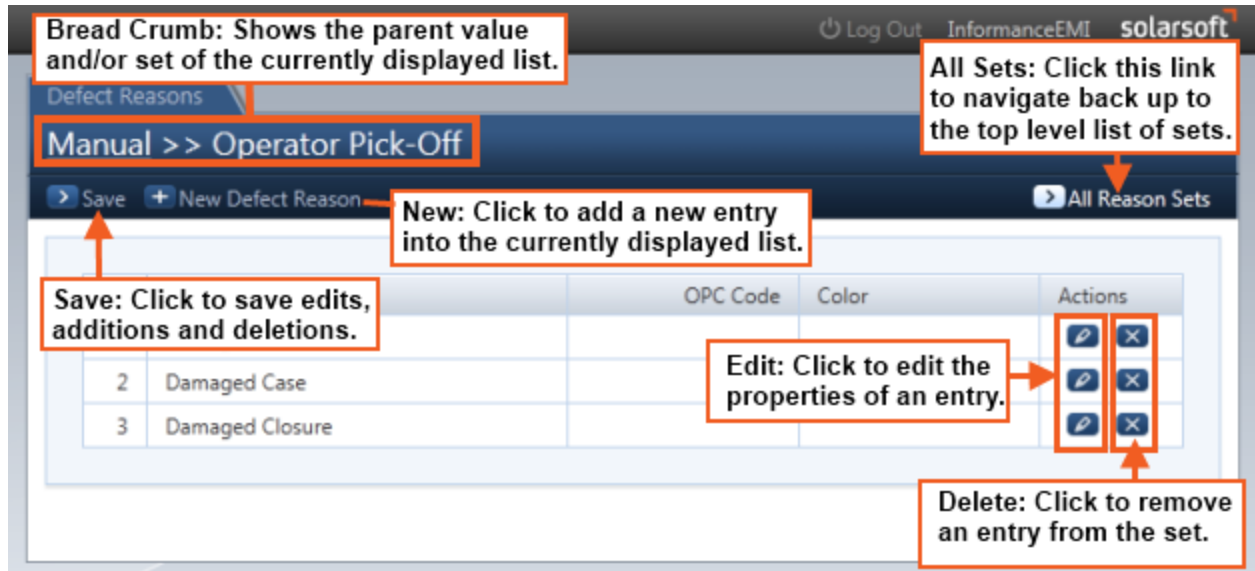

Figure 4: Components of System Administration Screen

As described, tagging sets can be multi-level and navigation within the set structure is driven by hyperlinks. Each set is presented as a hyperlink such that clicking on any set name will drill you into the list of entries within that set. In the case of defect and downtime reasons, you can drill in two and four levels deep, respectively. At each level the list is presented as hyperlinks until you reach the lowest level. Again, the bread crumb of the list will always indicate your current position within a set.

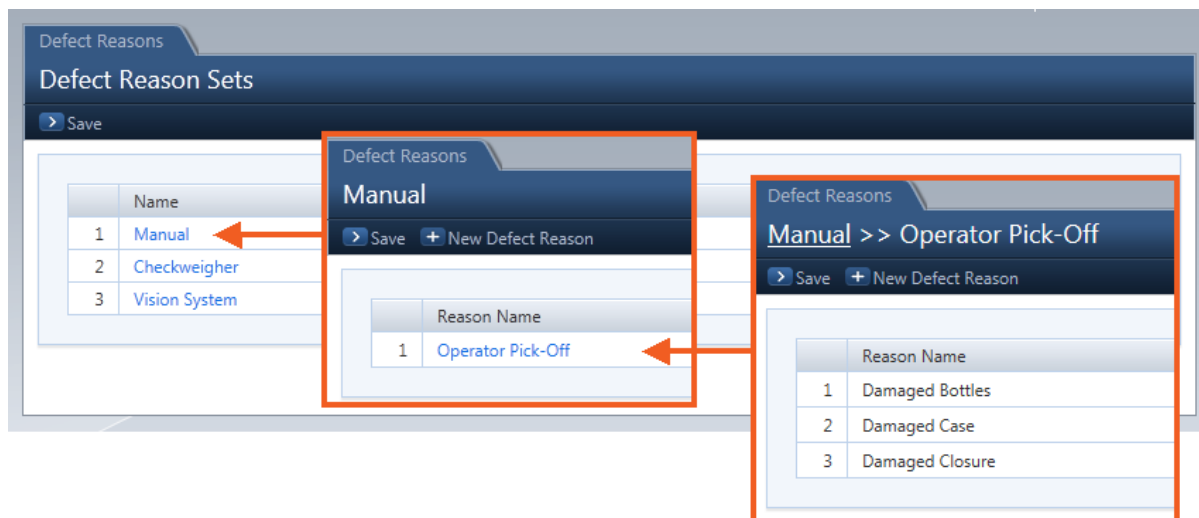

Figure 5: Example of Tagging Set Links

Additional Fields

One of the most powerful features of the Informance Plant Solution is the customizable *Additional Fields*. Customers can go beyond the traditional downtime reason, part and user tags and define an unlimited number of new tagging fields.

Unlike the 4 standard tagging fields, these additional fields can be named by you using your specific terminology. You can define a 'Batch' field, for example, to tag your data according to a unique Batch ID; or a 'Crew Size' field to track the number of operators on a line during different periods of production.

If you have defined additional fields for your Informance system, they will be presented as additional tabs within the system administration interface.

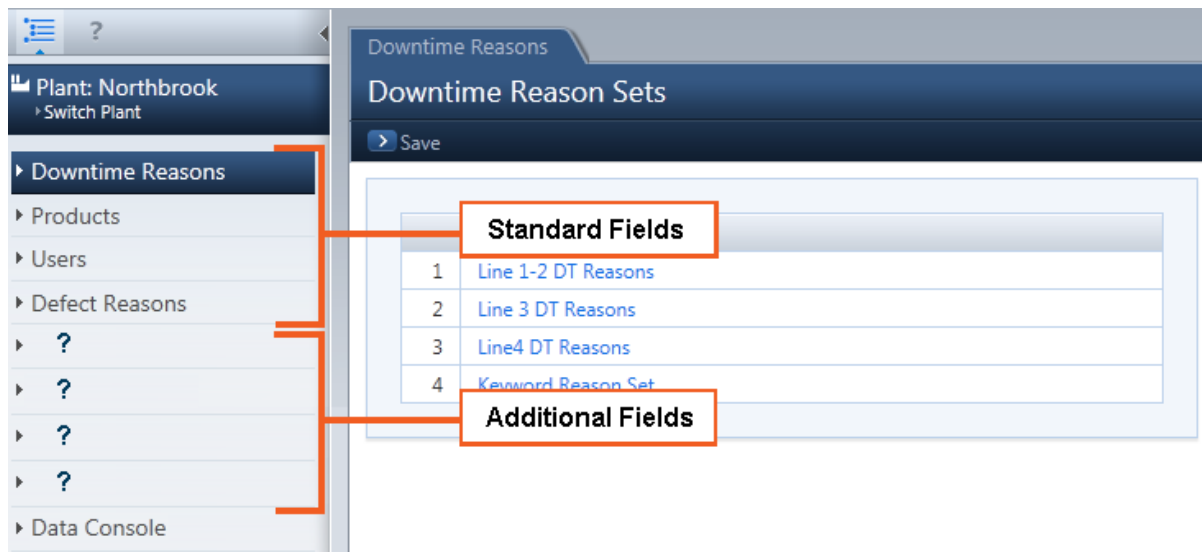

Figure 6: Standard and Additional Tabs

The example system used throughout this user guide has one additional field called 'Batch' which you will see in each image of the system administration interface (see example below). Again, the Batch field is not standard and you may not have such a tab in your system. It is used within this guide strictly to illustrate the possible presence of additional fields and thus additional tabs within the System Administration interface.

Figure 7: System Administration Interface with Additional Field Called 'Batch'

Saving Changes

Within the Informance System Administration module, it is important to understand how changes are saved and exactly what happens in the software whenever the save link () is clicked on any tab. When working within a tab, for example the *Downtime Reasons* tab, the interface allows you to add, delete or edit any of the lists. And, although you see your changes appear within that tab as you make them, they are not actually committed to the system until the save link is clicked. So if you were to close your browser or log out of the system without saving, all of your changes would be lost.

Tip. Entries that have been added but are unsaved appear in Italics. Once the Save button is pressed and the changes have been saved, the entry appears in normal text.

Whenever a save button () is clicked on any tab, both the data collection and IFA (operator entry) services will be recycled. This allows them to pull all lists and configuration settings fresh from the database and publish any changes you have made. Although this does not cause any loss of data collection, it does temporarily disable some operator entry features until the recycle is complete.

Specifically, during a recycle of the software, the asset status buttons are not updated and will be turned gray instead of the usual red or green color reflecting the state of the line (see image below). This is a visual indicator to the operator that system updates are in process. Also, no new downtime events are published into the operators event history during a recycle.

Typical red/green status buttons when software is running.

Status buttons turn gray during a software recycle.

The time it takes to complete a recycle will vary depending upon the size of the system. Most recycles take 3-4 minutes, but it can be longer if your system has many assets and/or very large downtime reason or product lists. For this reason, it is recommended that you click save only once after all of your changes have been made as opposed to saving after each edit. This will limit the disruptions to the operator interface.

Reporting Units

As you have probably learned by now, Informance's data collection focuses on production counts taken at various points in a manufacturing process. In many applications, the units counted at each monitoring point are different and tend to scale up as product moves through the process.

For example, consider a manufacturing line used to package liquid laundry detergent. First the individual bottles are filled, capped and labeled. Then multiple bottles are grouped into cartons, the cartons are grouped into cases, and the cases are finally stacked onto pallets.

To fully monitor this application on all assets with defect tracking, Informance would need to monitor the counts at several locations. Further, a mechanism must exist to allow these different counts to be reconciled based on a common elementary unit. This is where **Reporting Units** come in.

Reporting Units provide the means to represent production counts in different scales. Each asset in your Informance database can have a unique set of units or multiple assets can share a set. The reporting units can be global to the asset or vary by part depending upon the needs of the application.

Although Reporting Units help facilitate those applications where several monitoring points are used, they can also be applied to applications with just a single monitoring point. If your application just uses a single cycle count with no additional sensors for defect tracking, you may still use Reporting Units to scale those cycle counts as needed.

Hub Administration

When selecting the Hub in *System Administration*, you will be presented with a single administration tab labeled *Security*. This tab provides features allowing you to add, edit and delete system users.

Security

Within the *Security* tab of the Hub Administration, you will manage the list of system users – the active logins that are used to access the Plant Reporting and System Administration web sites. The *Security* tab has two sub-tabs: *Users* and *Roles*. The *Users* sub-tab allows you to manage the list of system users; the *Roles* tab provides information on the access of each role. It is recommended that you not adjust role security or define new roles without first consulting your Informance services engineer.

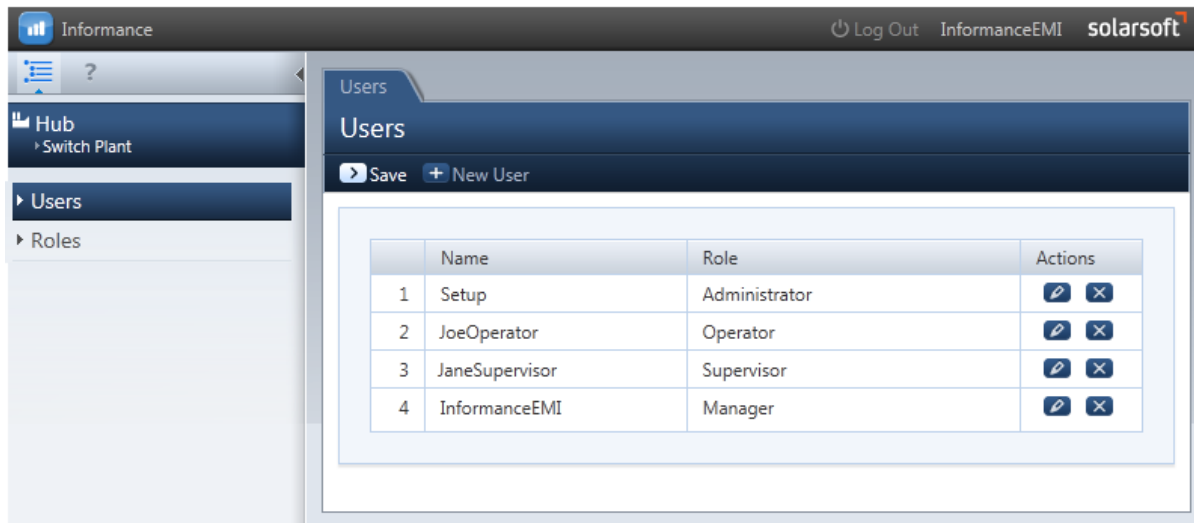

Figure 8: Hub Informance Users Screen

Adding a New System User

To create a new system user, click the *New User* button () in the upper left corner of the Users list to open the *New User* dialog box.

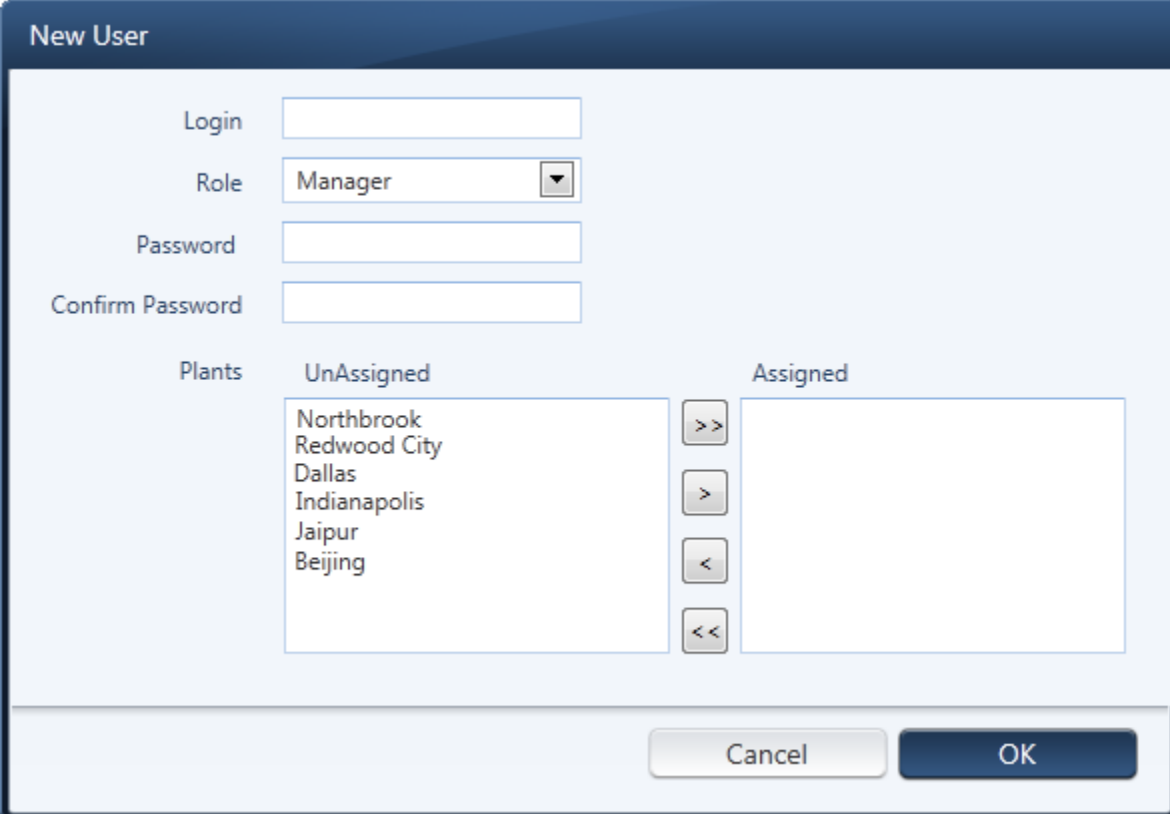

Figure 9: Adding a New User Screen

Fill out all fields in the *New User* dialog box:

- **Login:** Enter the username that will be used when logging in to Plant Reporting or System Administration. Logins must be unique and they cannot exceed 100 characters in length.
- **Role:** Assign this user to one of the defined roles for your system. Again, it is strongly recommended that you use the 'Administrator' role as this will expose the Configuration Features of the software.
- **Password / Confirm Password:** Enter a password for this user and confirm it in the box below. Passwords must be at least 6 characters in length and no more than 100 characters.
- **Plants:** Each user must be assigned to at least one plant. Select the plants from the *UnAssigned* column by clicking on them, and then use the arrow buttons in the center to move the selected plants to the *Assigned* column.

After completing the form, click the **OK** button in the lower right corner to close the dialog box. You will see your new user in the displayed list; however it is not yet saved. You must click the Save button () in the upper right corner of the screen to save your new entry. If you log out of System Administration or close your web browser without first clicking save, the new entry will be lost.

Editing an Existing System User

To edit the properties of an existing user, click the edit button (✎) for that user in the far right column of the list. The Edit dialog box will appear with the current settings populated in each field.

The screenshot shows the 'Edit User' dialog box. The 'Login' field is 'InformanceEMI'. The 'Role' dropdown is set to 'Manager'. The 'Password' and 'Confirm Password' fields are empty. The 'Plants' section has two columns: 'UnAssigned' and 'Assigned'. The 'UnAssigned' column contains a list of plants: Redwood City, Dallas, Indianapolis, Jaipur, and Beijing. The 'Assigned' column contains a list of plants: Northbrook. There are four arrow buttons between the columns: '>>', '>', '<', and '<<'. At the bottom right are 'Cancel' and 'OK' buttons.

Figure 10: Edit System User Screen

Simply edit the properties as needed and click the OK button in the lower right to close the *Edit User* dialog box. The same rules and restrictions described above for new users also apply to editing an existing user; the one exception is the Login property which cannot be edited after the user is created. Again, the edits you make are not saved until you click the Save button (▶ Save) in the upper right corner.

Deleting a System User

To remove a User, click the delete button (✕) for that user in the far right column. After clicking delete, the entry will immediately be removed from the displayed list. You must confirm your deletions by clicking the Save button (▶ Save) in the upper left corner. If you close your browser or log out without saving, your deletions will be restored.

Configuration Features

As discussed in the opening section of this user guide, the System Administration interface contains additional *Configuration Features* that are used by the installing engineer to define the basic elements of your Informance system. Following installation, these settings are rarely adjusted and therefore they are not included in the standard customer administration role.

In the Hub administration, these configuration features include a *Connections* tab used to define new databases for the system and an *Additional Fields* tab used to create new tagging fields. Again, it is strongly recommended that you assign any new users to the customer role that has been configured and not provide anyone these full administrative privileges. Improper adjustments to these settings could have serious consequences within the Informance system.

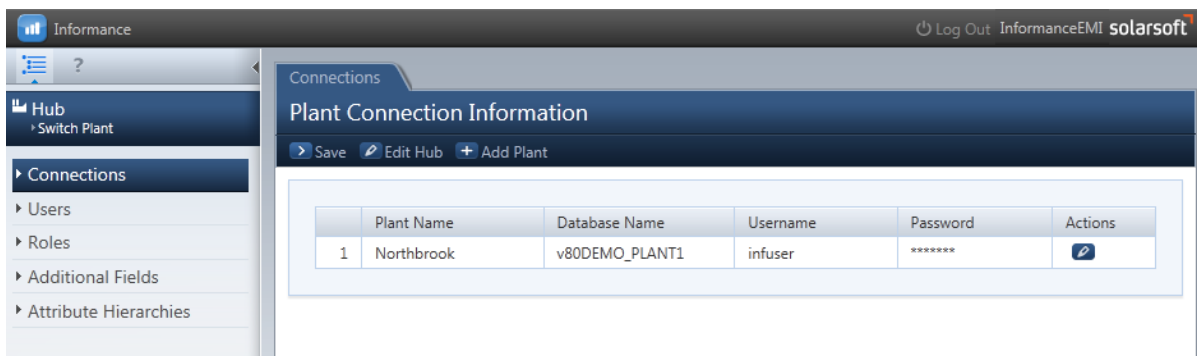

Figure 11: Hub Administration with Configuration Features Exposed

Plant Administration

When selecting a plant in *System Administration*, you will be presented with a set of administration tabs representing the different event tagging categories: Downtime Reasons, Defect Reasons, Products, Users and any additional fields that may be configured within your system. Within each tab you will find the different tagging sets that have been defined for that plant as well as the tools to add, edit and delete the entries within any set.

Downtime Reasons

Within the *Downtime Reasons* tab, you will manage the different sets of downtime reasons that exist within your system. Like all event tagging categories, downtime reasons are organized into sets. A downtime reasons set consists of a reason and subreason hierarchy that can be defined up to four levels deep with unlimited reasons at each level. Each set also encompasses the Color assignments, the OPC Codes that can be mapped to each reason and subreason for auto-tagging and the Super Reason mappings. Upon navigating to the *Downtime Reasons* tab, the list of downtime reasons sets within the plant will be displayed.

Figure 12: Downtime Reasons Tab

Hyperlinks provide the navigation within the Downtime Reasons tab and you will notice that each downtime reason set is presented as a hyperlink. Clicking any Reason Set will take you into that set, first displaying the list of top level reasons. The name of the reason set you have drilled into will appear above the reason list. The image below shows the list of reasons within a Reason Set labeled 'Lines 1-2 DT Reasons'.

The screenshot shows a web interface titled 'Downtime Reasons' with a sub-header 'Line 1-2 DT Reasons'. Below the header are navigation buttons: '> Save', '> Standard Costs', '+ New Reason', and '> All Reason Sets'. The main content is a table with the following data:

	Reason Name	OPC Code	Color	Super Reason	Expected Event Duration (minutes)	Cost Per Minute	Actions
1	Capper	500,501,502	■	Untagged		\$ 2 *	
2	Cartoner	600	■	Untagged		\$ 2 *	
3	Changeover		■	Untagged		\$ 2 *	
4	Filler		■	Untagged		\$ 2 *	
5	Labeler		■	Untagged		\$ 2 *	
6	Not Scheduled		■	Excluded from OEE		\$ 2 *	
7	Other		■	Untagged		\$ 2 *	
8	Waiting on ...		■	Untagged		\$ 2 *	

Figure 13: Second Level Downtime Reasons

You will note that the downtime reasons with the set are also presented as hyperlinks. Clicking on any downtime reason will navigate you to the list of second level subreasons beneath that reason. Above the subreason list you will see both the Reason Set and parent Reason of the subreason list. The image below shows the list of subreasons for a reason called 'Capper' within a reason set called 'Lines 1-2 DT Reasons'.

The screenshot shows the same 'Downtime Reasons' interface, but the sub-header is 'Line 1-2 DT Reasons >> Capper'. The table below shows subreasons for 'Capper':

	Reason Name	OPC Code	Color	Super Reason	Expected Event Duration (minutes)	Cost Per Minute	Actions
1	Bottle Jam			Mechanical / Short Stops		\$ 2 *	
2	Cap Jam in Chute	3		Mechanical / Short Stops		\$ 2 *	
3	Other Mechanical			Mechanical / Short Stops		\$ 2 *	

Figure 14: Example list of Subreasons

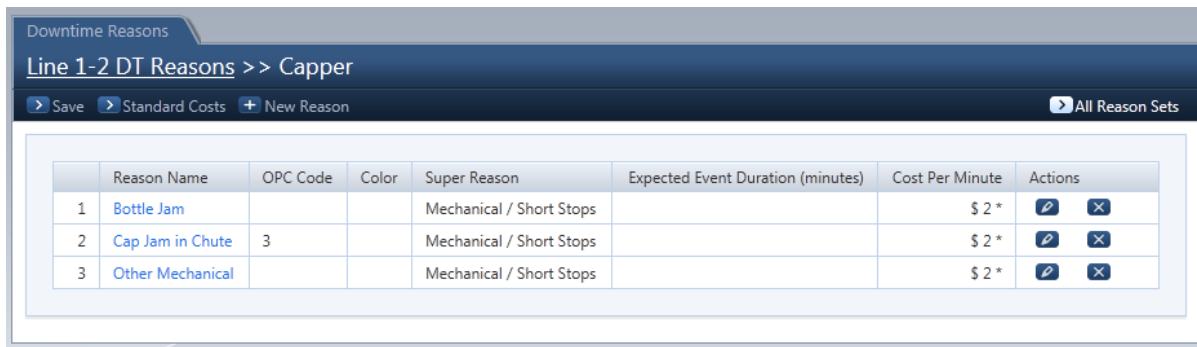

This type of hyperlink drill-in navigation allows you to move through all four reason-subreason levels of each reason set. At the fourth level that list will be displayed without hyperlinks indicating that you have reached the lowest point in the hierarchy. At any level, you can click the *All Sets* link above the list to drill all the way back out and return to the list of Reason Sets.

As each level of reasons or subreasons is presented, the table will also list the *OPC Codes*, *Color*, and *Super Reason* that have been mapped to each item in the list. The far right column provides buttons to edit or delete each reason. In the upper right corner above the list is a button to add a new reason at your current level.

Adding a New Downtime Reason / Subreason

As described above, each Reason Set is structured as four-level hierarchy of downtime reasons. The *New Reason* button () in the upper left corner of the tab allows you to add a reason to the currently displayed level in the hierarchy. So before adding a new downtime reason or subreason, you must first drill-in to the reason set and display the reason or subreason level where this new reason should be placed.

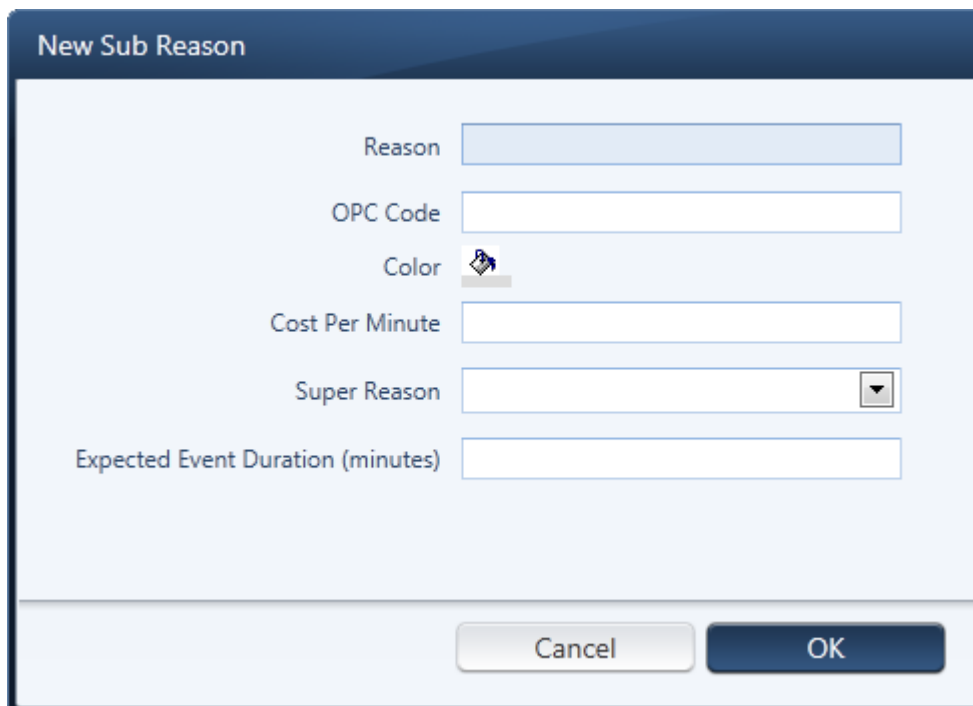

For example, to add a second-level subreason to the 'Capper' reason, that list of subreasons must first be displayed by clicking on the reason set and then the 'Capper' reason.

The screenshot shows the 'Downtime Reasons' window with the breadcrumb 'Line 1-2 DT Reasons >> Capper'. The interface includes buttons for 'Save', 'Standard Costs', 'New Reason', and 'All Reason Sets'. Below is a table with the following data:

	Reason Name	OPC Code	Color	Super Reason	Expected Event Duration (minutes)	Cost Per Minute	Actions
1	Bottle Jam			Mechanical / Short Stops		\$ 2 *	 
2	Cap Jam in Chute	3		Mechanical / Short Stops		\$ 2 *	 
3	Other Mechanical			Mechanical / Short Stops		\$ 2 *	 

Upon clicking the *New Reason* button () in the upper left corner, the New Reason dialog box will appear.

The 'New Sub Reason' dialog box contains the following fields and controls:

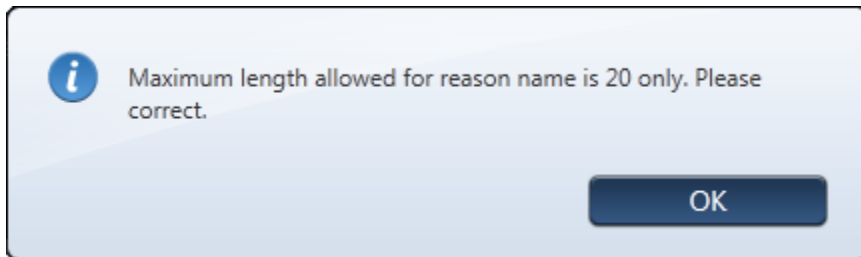

- Reason:
- OPC Code:
- Color: 
- Cost Per Minute:
- Super Reason: 
- Expected Event Duration (minutes):

At the bottom, there are 'Cancel' and 'OK' buttons.

Figure 15: New Sub Reason Screen

To create your new reason or subreason, first enter the name of this new entry in the *Reason* box of the new reason dialog. The reason name is the only required field within the *New Reason* dialog; OPC Code, Color, Super Reason and Expected Event Duration are optional.

Be aware that reasons and subreasons cannot exceed 20 characters in length. If you exceed 20 characters, your entry will not be accepted and the following error message will appear prompting you to correct it:

If you wish to assign OPC Codes for auto-tagging, those integer codes can be entered into the *OPC Code* field. To assign multiple integer codes to this new reason, enter the codes as a comma-separated list (i.e. 2, 4, and 15,138). If you will not be assigning an OPC Code, simply leave the field blank. Do not enter an OPC Code of 0 as it is a reserved value and will not be accepted.

You can assign a color to this reason which will be used in all charts and graphs in the Plant Reporting module. Any reason that does not have an explicit color assignment will be assigned a color from the default palette based on its order of precedence in that specific chart. So without a specific color assignment, the Plant Reporting module will most likely assign a different color to the reason from day to day and chart to chart. To assign a color to your new reason, click on the paint bucket then select a color from the pop-up color palette.

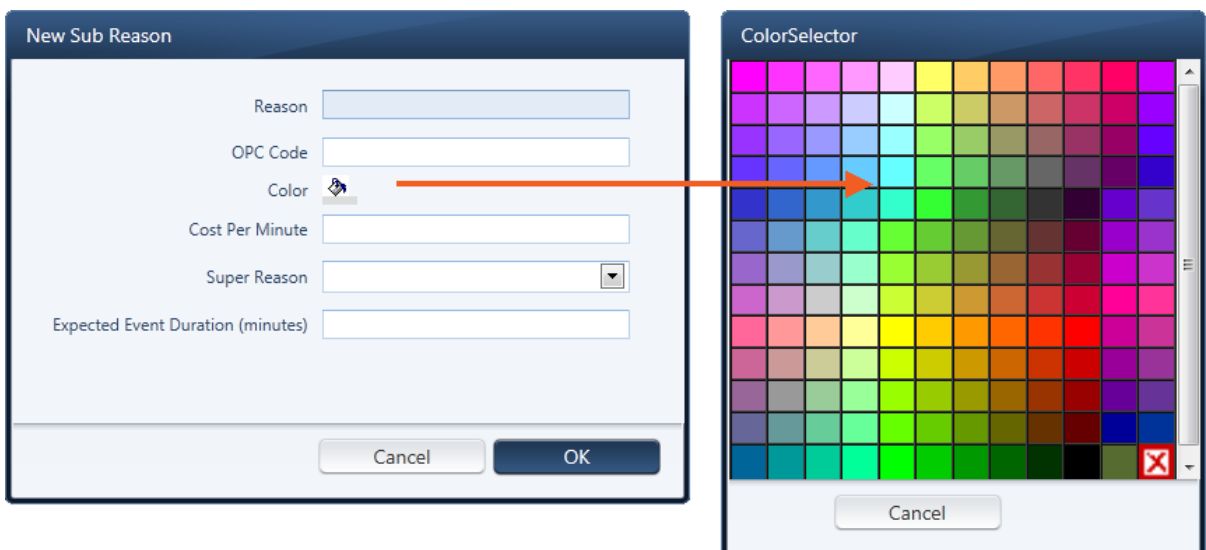

Figure 16: Downtime Reason Color Assignment

To assign a color, click on the paint bucket then select a color from the pop-up color palette.

In the Cost per Minute field, enter the costs per minute for downtime caused by this downtime reason. The Financial Analysis and Financial Timeline tabs use these values as part of the calculation (downtime costs per minute * time down) to determine the financial impact downtime has on your business.

The next field to complete for a new reason is the *Super Reason* assignment. Click the Super Reason drop-down box to select the appropriate Super Reason for this entry or leave the field blank if you do not intend to map it.

Important. Super Reason mappings are not inherited at lower levels. In other words, if you were to map a Level 1 Reason called 'Capper' to a Super Reason named 'Mechanical Downtime', the Level 2, 3 and 4 subreasons beneath 'Capper' would not automatically be mapped to this same Super Reason. Every reason has its own explicit mapping to a Super Reason regardless of which level it resides in the hierarchy. The Super Reason of 'Mechanical Downtime' would be applied in this example to a downtime event that had been tagged as 'Capper' with all subreason levels left blank.

The last parameter you can set for a new reason is the *Expected Event Duration*. This parameter will define your expected duration for a downtime event that is tagged to this reason. When the expected duration has elapsed, the operators will be notified by a color change in the operator interface (IFA).

For example, let's assume you created a reason called 'Changeover' with an expected event duration of 20 minutes. Then assume that your production line stops and the operator selects the new 'Changeover' downtime reason within the Informance operator entry screen to tag the current downtime event. Now that the event has been tagged, the expected duration is in effect. As the 20 minute duration approaches, the buttons on the operator interface will turn yellow as a warning to the operator. Should the event exceed 20 minutes, the buttons will turn red. Once the line begins running again and the downtime event ends, the operator screen will return to its normal color.

The screenshot shows the 'CURRENT' tab with the following elements:

- Current Context Field Value:** Reason : Changeover (14:23)
- Current Run Field Value:** User : , Part :
- Buttons:** Downtime Reason Codes (yellow), User (yellow), Part (yellow), Terminate Event (white), Notes (yellow)

Event duration is about to elapse (buttons turn yellow).

The screenshot shows the 'CURRENT' tab with the following elements:

- Current Context Field Value:** Reason : Changeover (14:23)
- Current Run Field Value:** User : , Part :
- Buttons:** Downtime Reason Codes (red), User (red), Part (red), Terminate Event (white), Notes (red)

Event duration has elapsed (buttons turn red).

After completing the *New Reason* dialog, click the **OK** button at the bottom to close it. Your new reason will now appear in the displayed list. However, IT IS NOT YET SAVED. You must click the **Save** button ( Save) in the upper left corner to save your new entry into the reason set. If you log out of System Administration or close your web browser without clicking save first, your entry will be lost. If you try to navigate to another tab without saving changes, you will be prompted to save first.

Editing an Existing Downtime Reason / Subreason

To edit the name, OPC Codes, Color, Costs per Minute or Super Reason assignment of an existing reason, click the edit button () for that reason in the far right column of the list. The Edit dialog box will appear with the current settings populated in each field.

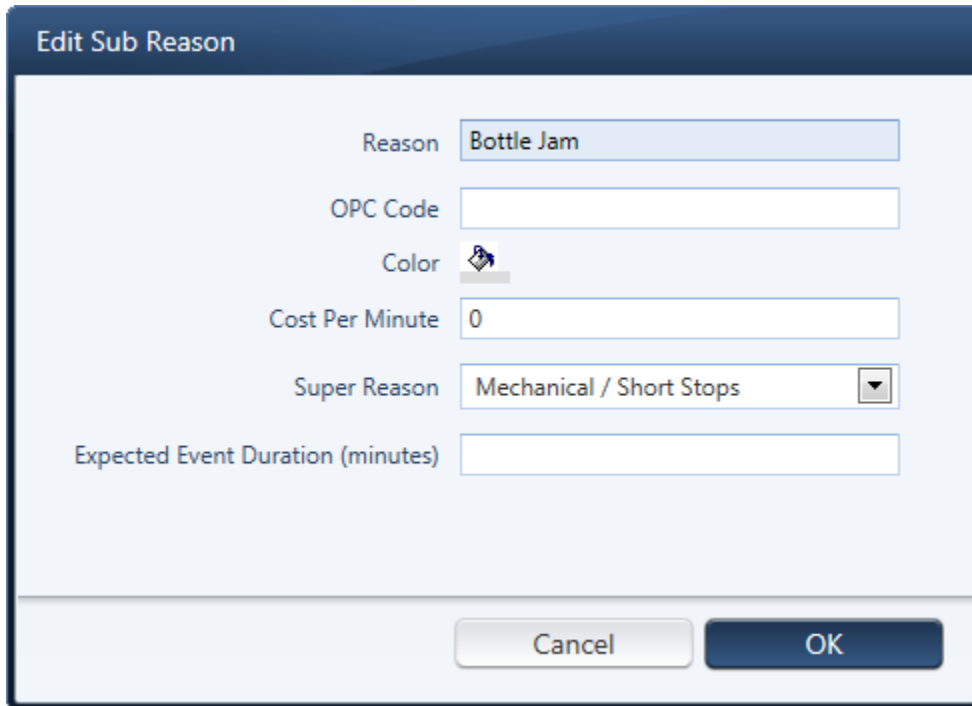

Figure 17: Edit Downtime Sub Reason Screen

Simply edit the fields as needed and click **OK** to close the edit dialog box. The same rules and restrictions mentioned above for creating a *New Reason* also apply when editing a reason:

Reasons cannot exceed 20 characters

The OPC Code, Color, Super Reason and Expected Event Duration fields are optional and the OPC Code must be greater than 0. If you need to assign multiple OPC Codes, enter them as a comma-separated list (i.e. 2, 4, 5, 6, 23).

You must click the Save button () after editing a reason in order for your changes to be saved.

Deleting an Existing Downtime Reason / Subreason

To remove a reason, click the delete button () for that reason in the far right column. After clicking delete, the entry will immediately be removed from the displayed list. You must confirm your deletions by clicking the Save button () in the upper left corner. If you close your browser or log out without saving, your deletions will be restored.

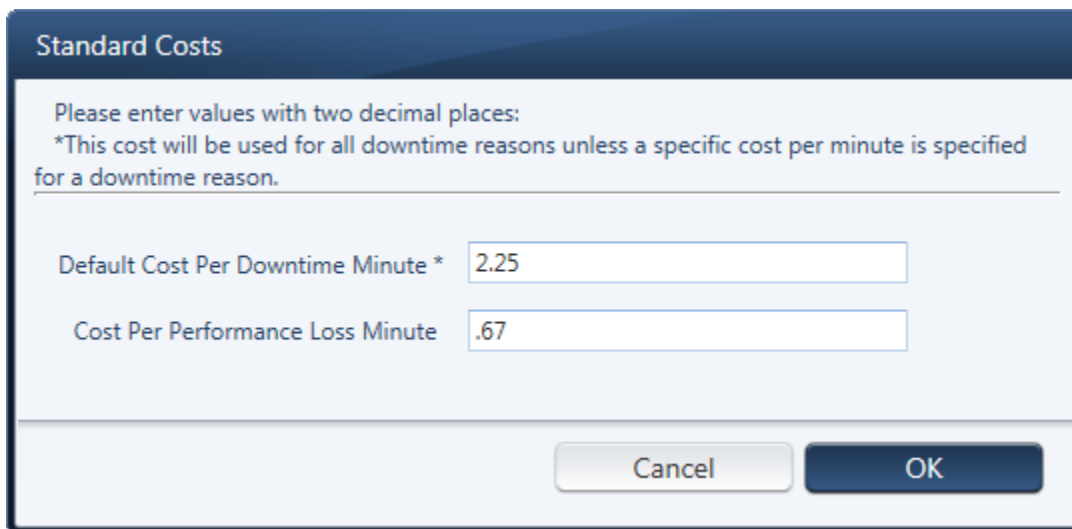

Defining Standard Downtime Reason Costs

You can define a default standard cost for all downtime reasons. If you define standard costs, any downtime reason without a defined cost will automatically use this cost. However, any downtime reason with a specified cost will use the cost defined for it and not the standard cost.

You can also define standard costs for performance loss due to slow performance.

Standard downtime costs can be defined at one of the downtime reason sublevels. The link does not appear at the top level of downtime reason.

To set standard downtime reason costs, click the Standard Costs button () in the upper left corner of the tab.

The image shows a dialog box titled "Standard Costs". It contains the following text and fields:

Please enter values with two decimal places:
*This cost will be used for all downtime reasons unless a specific cost per minute is specified for a downtime reason.

Default Cost Per Downtime Minute *

Cost Per Performance Loss Minute

At the bottom right, there are two buttons: "Cancel" and "OK".

Figure 18: Downtime Reason Standard Costs Screen

To assign a default cost per minute of downtime, enter the cost in the Default Cost per Downtime Minute field. This value will apply to all downtime reasons that do not have downtime costs assigned to them. If a downtime reason has a defined cost, that cost will be used when calculating the costs of the downtime.

The downtime cost is used in the Financial Analysis and Financial Timeline tabs as part of the calculation to analyze the financial impact of downtime events.

To assign a default cost per minute caused by production slows; enter the cost in the Cost per Performance Loss Minute field.

Performance loss is measured by comparing the actual recorded production count to the defined ideal count for the produced part. For example, a line running Part X with an ideal rate of 1000 units per hour runs for 60 minutes but only produces 900 units. That would indicate a performance loss of 10% or effectively 6 minutes of loss due to slow performance.

In our financial reports, these calculated lost minutes due to performance are shown along with actual downtime minutes to show the full picture of losses.

Important - The cost values in this screen must be entered with two decimal places.

After completing the *Standard Costs* dialog, click the **OK** button at the bottom to close it. However, **IT IS NOT YET SAVED**. You must click the *Save* button in the upper left corner to save your new entry into the reason set. If you log out of System Administration or close your web browser without clicking save first, your entry will be lost. If you try to navigate to another tab without saving changes, you will be prompted to save first.

Products

Within the *Products* tab, you will manage the different Product sets that exist within your system. Like all event tagging categories, Parts are organized into *sets*. However, the sets are flat lists of parts not multi-level hierarchies like Downtime and Defect Reasons.

When you first navigate to the Products tab, all Product sets for the plant will be presented along with the *Number of Parts* within each set and the name of its Reporting *Unit Set*.

	Name	Number of Parts	Unit Set
1	Line1 Products	4	Bottles-Cartons-Cases
2	Line2 Products	4	Bottles-Cartons-Cases
3	Line3 Products	3	Bottles-Cartons-Cases
4	Line4 Products	2	Bottles-Cases

Figure 19: Products Tab

Each Product Set is listed as a hyperlink and clicking on the name of any set will drill you in to the list of Parts within that set. The image below shows the list of Parts within a product set called 'Line1 Products'.

The screenshot shows a web application interface for 'Products' with a sub-section for 'Line1 Products'. Below the header, there are navigation buttons: 'Save', 'Standard Costs', and 'NewPart'. On the right, there is a link for 'All Product Sets'. The main content is a table with the following data:

	Name	Description	Status	Ideal Rate	Major DT	Minor DT	OPC Code	Cost Per Elementary Unit	Bottle	Carton	Case	Actions
1	48oz Brand A	48oz Brand A	Active (Inactivate)	3600	0	0	1	\$ 1	1	6	12	[Edit] [Delete]
2	48oz Brand B	48oz Brand B	Active (Inactivate)	3600	0	0	2	\$ 1.1	1	6	12	[Edit] [Delete]
3	64oz Brand A	64oz Brand A	Active (Inactivate)	3000	0	0	3	\$ 1.25	1	4	8	[Edit] [Delete]
4	64oz Brand B	64oz Brand B	Active (Inactivate)	3000	0	0	4	\$ 1.38	1	4	8	[Edit] [Delete]

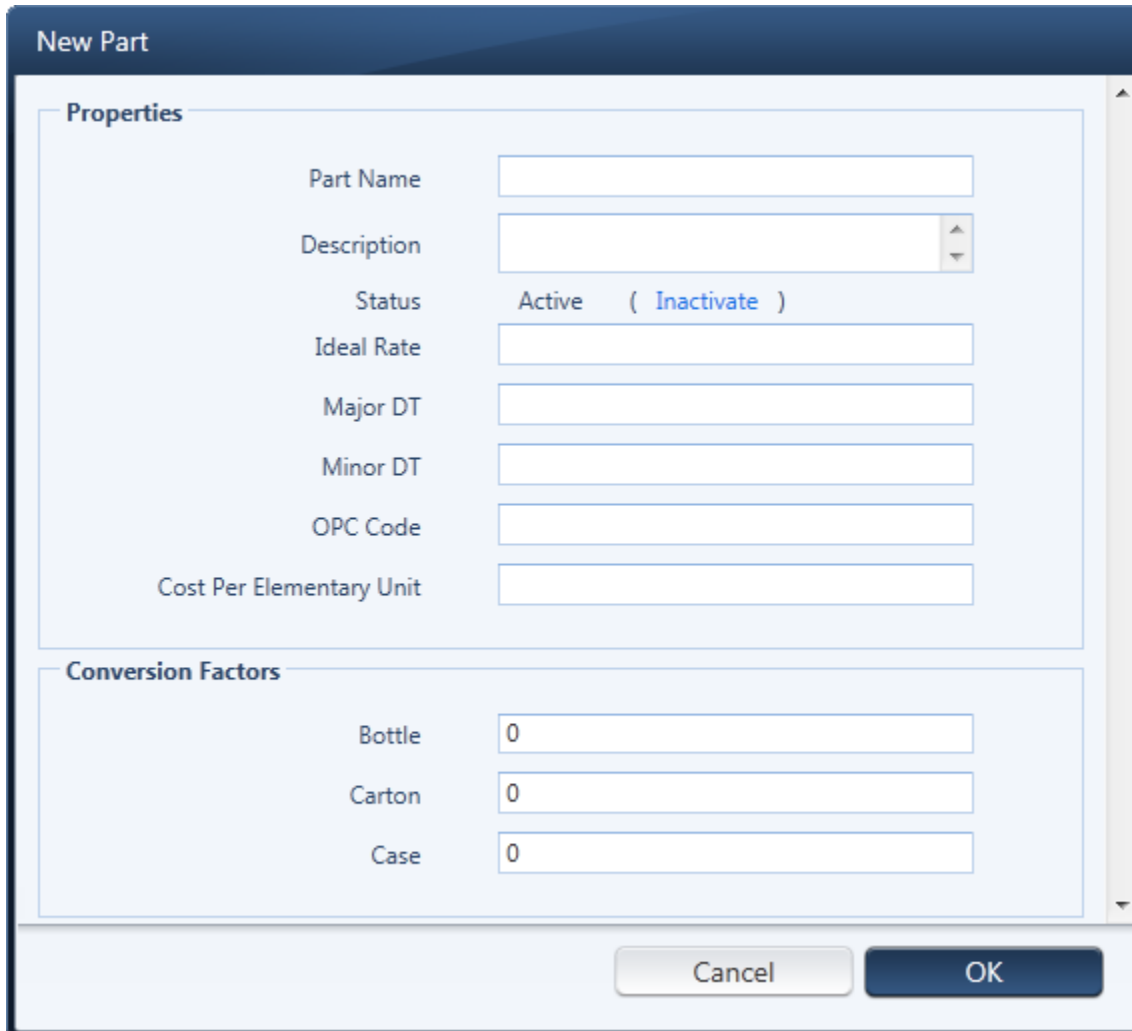

Figure 20: Example of Parts list within a Part Set

Above the list of parts you will see the name of the Product Set, in this case 'Line1 Products', as well as an *All Sets* link which will navigate you back up to the list of Product Sets when clicked.

Along with the name of each part in the product set, you will also find the values for each property of the part. Parts are a unique tagging field within Informance in that their properties like *Ideal Rate* determine key calculations within the reporting like Performance and OEE.

Adding a Product

When viewing the parts within a product set, the New Part button () will be visible in the upper left corner. Clicking it will open the New Part dialog box allowing you to define a new part for the set.

The image shows a 'New Part' dialog box with two main sections: 'Properties' and 'Conversion Factors'. The 'Properties' section includes fields for Part Name, Description, Status (Active/Inactivate), Ideal Rate, Major DT, Minor DT, OPC Code, and Cost Per Elementary Unit. The 'Conversion Factors' section includes fields for Bottle, Carton, and Case, all with a value of 0. At the bottom are 'Cancel' and 'OK' buttons.

Properties	
Part Name	<input type="text"/>
Description	<input type="text"/>
Status	Active (Inactivate)
Ideal Rate	<input type="text"/>
Major DT	<input type="text"/>
Minor DT	<input type="text"/>
OPC Code	<input type="text"/>
Cost Per Elementary Unit	<input type="text"/>

Conversion Factors	
Bottle	<input type="text" value="0"/>
Carton	<input type="text" value="0"/>
Case	<input type="text" value="0"/>

Figure 21: New Part Creation Screen

To complete the *New Part* form, first fill out the properties section:

- **Name** - The name of the new part as it will appear in the operator interface and the analytics. Part names cannot exceed 50 characters.
- **Description** - A description for that part which cannot exceed 255 characters.
- **Status** - Status of the item. The status for a new part defaults to active. To make the part inactive, click the Inactivate link.

- **Ideal Rate** - The number of elementary units of this product that would ideally be produced in an hour of uptime. This is a required field and must be an integer representing the ideal production rate in elementary units per hour.
- **Major DT** - If you are using Informance's *Variable Thresholds by Part* setting, then enter the part-specific major downtime threshold in this field; otherwise enter a 0. Variable thresholds are only used when there is a wide range of run rates on an asset. Most users will enter a 0 here.
- **Minor DT** - If you are using Informance's *Variable Thresholds by Part* setting, then enter the part-specific minor downtime threshold in this field; otherwise enter a 0. Variable thresholds are only used when there is a wide range of run rates on an asset. Most users will enter a 0 here.
- **OPC Code** - If you are auto-tagging the part through the assets PLC or control system, then enter the integer code here that will represent this part. If the PLC will use multiple OPC Codes to auto-tag this part, then enter the codes as a comma-separated list (i.e. 2,8,37,124). If you are not auto-tagging the part, then leave this field blank. Do not enter an OPC Code of 0 as it is a reserved value and will not be accepted.
- **Cost per Elementary Unit:** Enter the costs of producing one unit of this product. The part cost is used in the Financial Analysis and Financial Timeline tabs as part of the calculation to analyze the financial impact of product events such as defect creation.

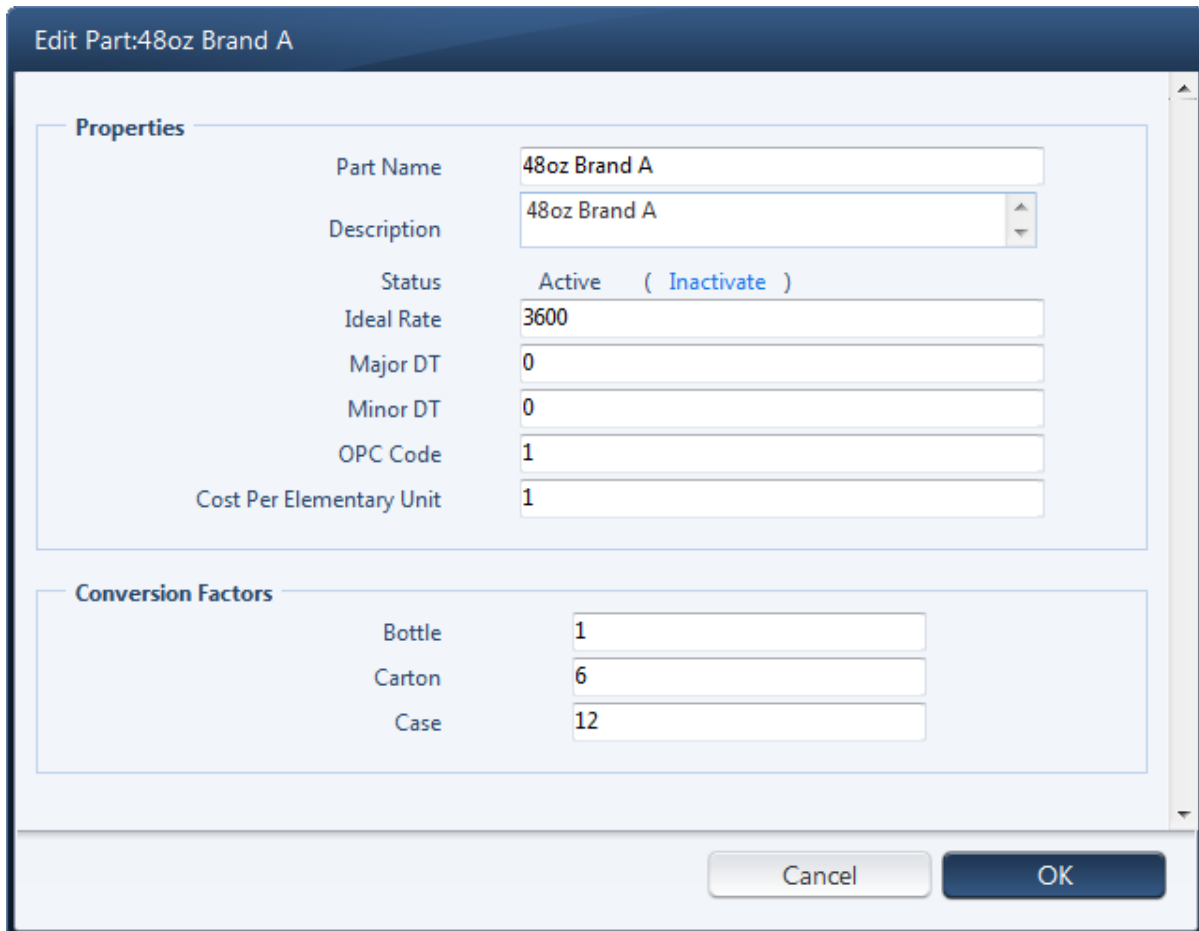

Below the properties section you will find the *Conversion Factors* section for each reporting unit. Unlike the properties section which is standard for all parts, the list of reporting units are specific to your application and can vary by part set.

It is important to remember that the values you enter for each conversion factor represent the number of elementary units per reporting unit for that part. For example, the image above shows reporting units of Bottle, Carton and Case where Bottle is the elementary unit. If a specific part within this set were packaged as 6 bottles per carton and 2 cartons (12 bottles) per case, the conversion factors would be 1 for bottle, 6 for carton and 12 for case.

After completing the *New Part* dialog, click the **OK** button at the bottom to close it. Your new part will now appear in the displayed list. However, IT IS NOT YET SAVED. You must click the **Save** button () in the upper left corner to save your new entry into the product set. If you log out of System Administration or close your web browser without clicking save first, your entry will be lost. If you try to navigate to another tab without saving changes, you will be prompted to save first.

Editing an Existing Product

To edit the properties or conversion factors of an existing part, click the edit button () for that part in the far right column of the list. The Edit dialog box will appear with the current settings populated in each field.

Properties	
Part Name	48oz Brand A
Description	48oz Brand A
Status	Active (Inactivate)
Ideal Rate	3600
Major DT	0
Minor DT	0
OPC Code	1
Cost Per Elementary Unit	1

Conversion Factors	
Bottle	1
Carton	6
Case	12

Figure 22: Edit Part Screen

Simply edit the properties or conversion factors as needed and click OK to close the *Edit Part* dialog box. The same rules and restrictions described above for new parts also apply to editing an existing part. Again, the edits you make are not saved until you click the Save button ( Save) in the upper left corner.

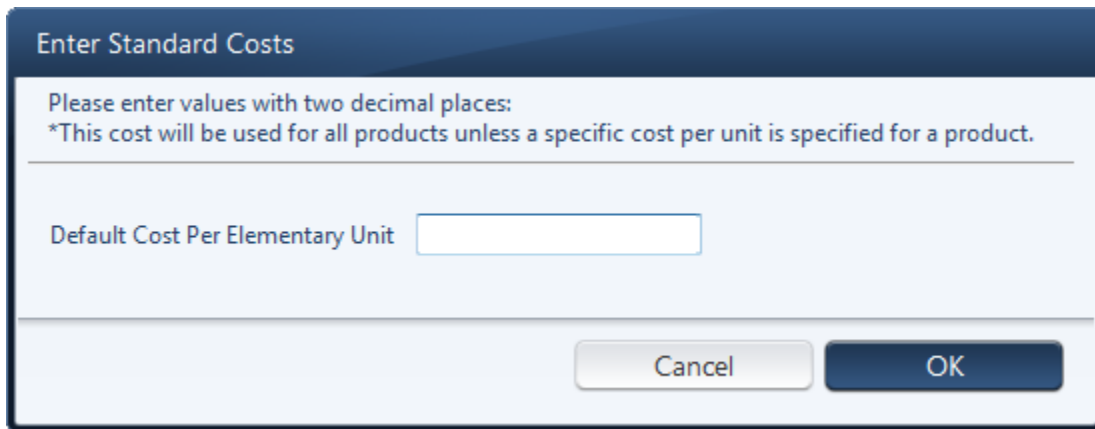

Deleting an Existing Product

To remove a part, click the delete button () for that part in the far right column. After clicking delete, the entry will immediately be removed from the displayed list. You must confirm your deletions by clicking the Save button ( Save) in the upper left corner. If you close your browser or log out without saving, your deletions will be restored.

Defining Standard Part Costs

You can define a default standard cost for all products. If you define standard costs, any product without a defined cost will automatically use this cost. However, any product with a specified cost will use the cost defined for it and not the standard cost.

To set standard product costs, click the **Standard Costs** button () in the upper left corner of the tab.

The dialog box titled "Enter Standard Costs" has a blue header. Below the header, it contains the text: "Please enter values with two decimal places: *This cost will be used for all products unless a specific cost per unit is specified for a product." Below this text is a horizontal line, followed by the label "Default Cost Per Elementary Unit" and an empty text input field. At the bottom of the dialog, there are two buttons: "Cancel" and "OK".

Figure 23: Product Standard Costs Screen

To assign a default cost per elementary unit of the product, enter the cost in the Default Cost per Elementary Unit field. This value will apply to all products that do not have costs assigned to them. If a product has a defined cost, that cost will be used when calculating the costs of production events such as defects.

The product cost is used in reports such as the Financial Analysis and Financial Timeline tabs as part of the calculation to analyze the financial impact of product defects.

Important - The cost values in this screen must be entered with two decimal places.

After completing the *Standard Costs* dialog, click the **OK** button at the bottom to close it. However, **IT IS NOT YET SAVED**. You must click the *Save* button in the upper left corner to save your new entry. If you log out of System Administration or close your web browser without clicking save first, your entry will be lost. If you try to navigate to another tab without saving changes, you will be prompted to save first.

Users

Within the *Users* tab, you will manage the different User sets that exists within your system. Like all event tagging categories, Users are organized into sets, however, the sets are flat lists of users not multi-level hierarchies like Downtime and Defect Reasons.

When you first navigate to the Users tab, all User sets for the plant will be presented along with the *Number of Users* within each set.

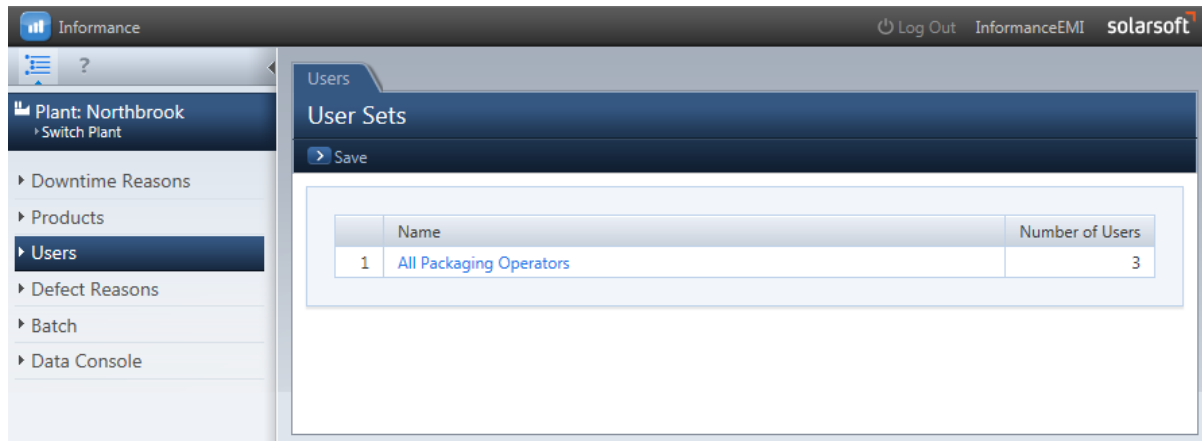

Figure 24: Users Tab

Each User Set is listed as a hyperlink and clicking on the name of any set will drill you in to the list of Users within that set. The image below shows the list of Users within a set called 'All Packaging Operators'.

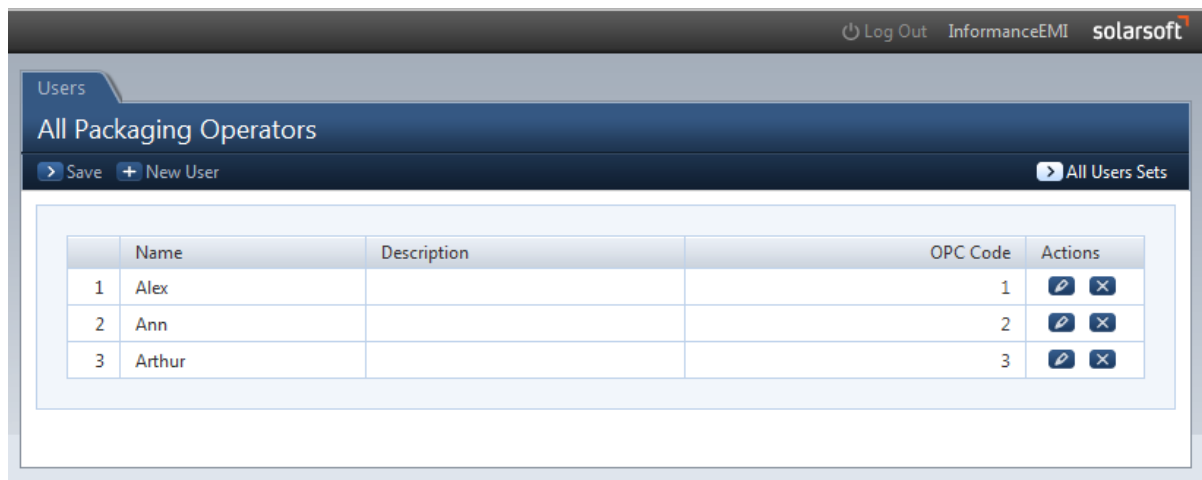

Figure 25: Users List

Above the list of users you will see the name of the User Set, in this case 'All Packaging Operators', as well as an *All Sets* link which will navigate you back up to the list of User Sets when clicked.

Along with the name of each user in the set, you will also find the values for each property of the user. Users have two optional properties: Description and OPC Code.

Adding a New User

When viewing the users within a user set, the *New User* button () will be visible in the upper right corner. Clicking it will open the *New User* dialog box allowing you to define a new entry for the set.

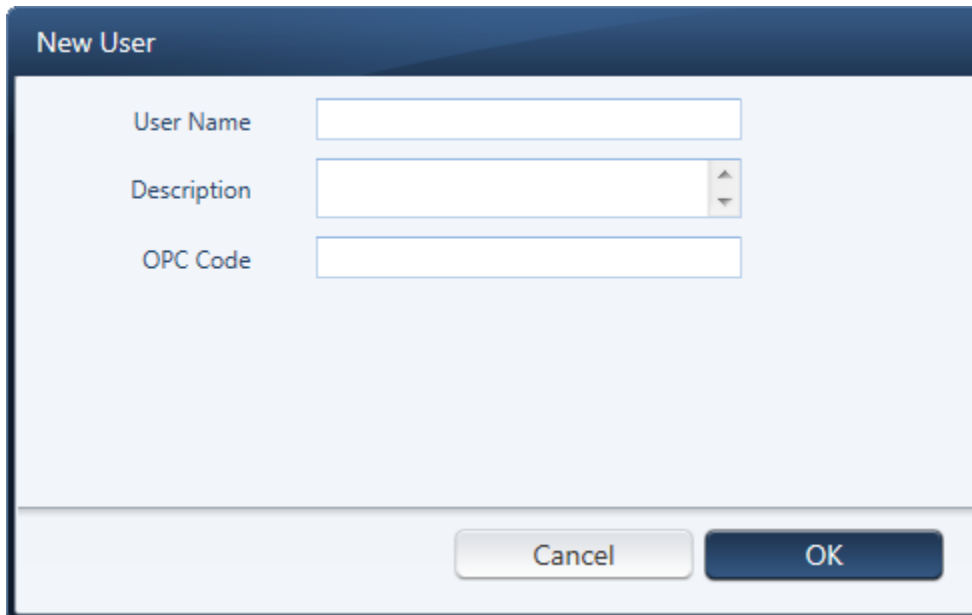

The image shows a 'New User' dialog box with a dark blue header. It contains three input fields: 'User Name' (a text box), 'Description' (a text box with a vertical scrollbar), and 'OPC Code' (a text box). At the bottom, there are two buttons: 'Cancel' and 'OK'.

Figure 26: Add New User Screen

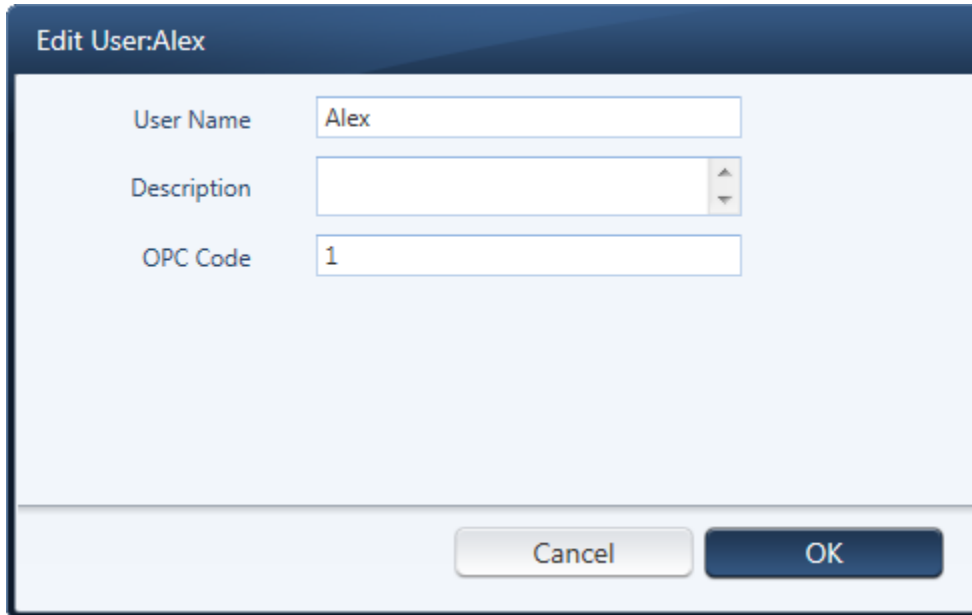

To complete the *New User* form, first fill out the form:

- **Name** - The name of the new user as it will appear in the operator interface and the analytics. User names cannot exceed 50 characters.
- **Description** - An optional description for that user which cannot exceed 255 characters.
- **OPC Code** - If you are auto-tagging the user through the assets PLC or control system, then enter the integer code here that will represent this new user. If the PLC will use multiple OPC Codes to auto-tag this user, then enter the codes as a comma-separated list (i.e. 2,8,37,124). If you are not auto-tagging the user, then leave this field blank. Do not enter an OPC Code of 0 as it is a reserved value and will not be accepted.

After completing the *New User* dialog, click the **OK** button at the bottom to close it. Your new user will now appear in the displayed list, however, IT IS NOT YET SAVED. You must click the **Save** button () in the upper left corner to save your new entry into the user set. If you log out of System Administration or close your web browser without clicking save first, your entry will be lost. If you try to navigate to another tab without saving changes, you will be prompted to save first.

Editing an Existing User

To edit the properties of an existing user, click the edit button (✎) for that user in the far right column of the list. The Edit dialog box will appear with the current settings populated in each field.

The screenshot shows a dialog box titled "Edit User:Alex". It contains three input fields: "User Name" with the value "Alex", "Description" which is empty, and "OPC Code" with the value "1". At the bottom right, there are two buttons: "Cancel" and "OK".

Figure 27: Edit User Screen

Simply edit the properties as needed and click the OK button in the lower right to close the *Edit User* dialog box. The same rules and restrictions described above for new users also apply to editing an existing user. Again, the edits you make are not saved until you click the Save button

(▶ Save) in the upper left corner.

Deleting an Existing User

To remove a User, click the delete button (✕) for that user in the far right column. After clicking delete, the entry will immediately be removed from the displayed list. You must confirm your deletions by clicking the Save button (▶ Save) in the upper left corner. If you close your browser or log out without saving, your deletions will be restored.

Defect Reasons

Within the *Defect Reasons* tab, you will manage the different sets of defect reasons that exist within your system. Like all event tagging categories, defect reasons are organized into sets. A downtime reasons set consists of a reason and subreason hierarchy that can be defined up to two levels deep with unlimited reasons at each level. Each set also encompasses the Color assignments and OPC Codes that can be mapped to each reason and subreason for auto-tagging. Upon navigating to the *Defect Reasons* tab, the list of defect reasons sets within the plant will be displayed.

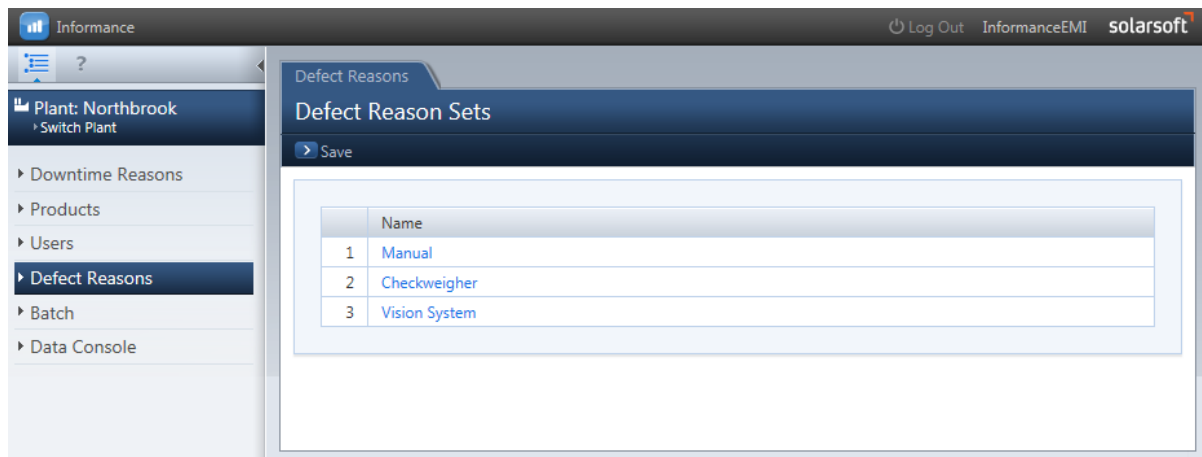

Figure 28: Defect Reasons Tab

Hyperlinks provide the navigation within the Defect Reasons tab and you will notice that each defect reason set is presented as a hyperlink. Clicking any Reason Set will take you into that set, first displaying the list of top level reasons. The name of the reason set you have drilled into will appear above the reason list. The image below shows the list of reasons within a Reason Set labeled 'Manual'.

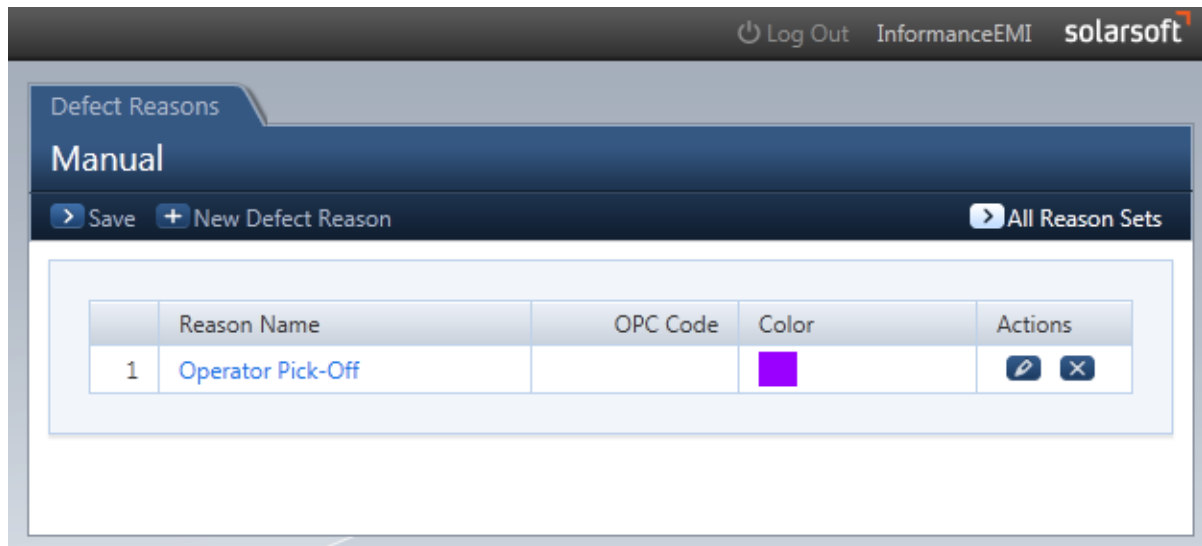

Figure 29: Defect Reason List

You will note that the defect reasons within the set are also presented as hyperlinks. Clicking on any defect reason will navigate you to the list of subreasons beneath that reason. Subreason is the lowest level in the defect reason hierarchy, therefore the subreasons will not be listed as hyperlinks indicating that there is no further drill-in. At either the reason or subreason level you can drill back out to the list of reasons sets by clicking the *All Sets* link above the list.

Above the subreason list you will see both the Reason Set and Reason that you have drilled into. The image below shows the list of subreasons for a reason called 'Operator Pick-Off' within a reason set called 'Manual'.

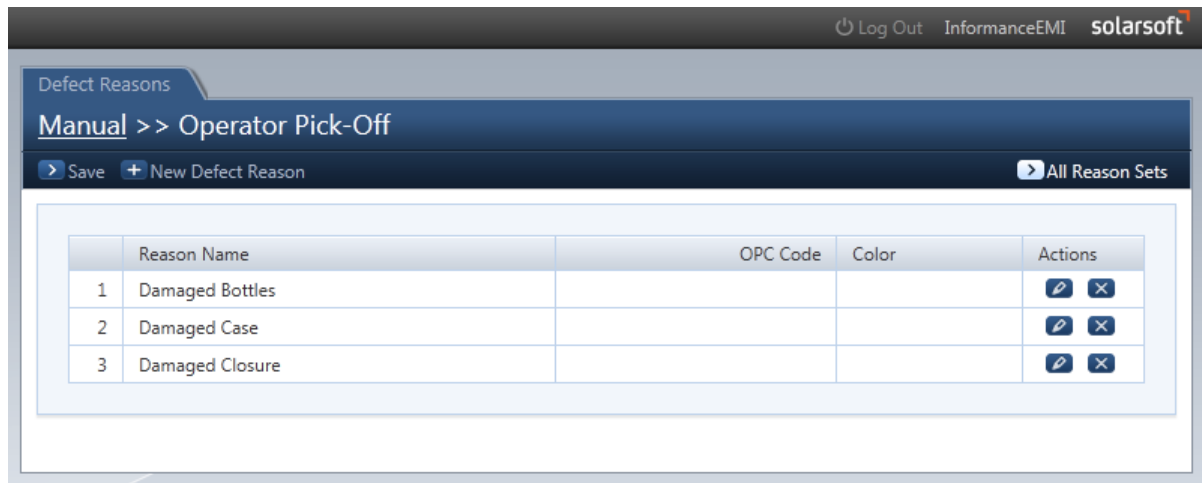

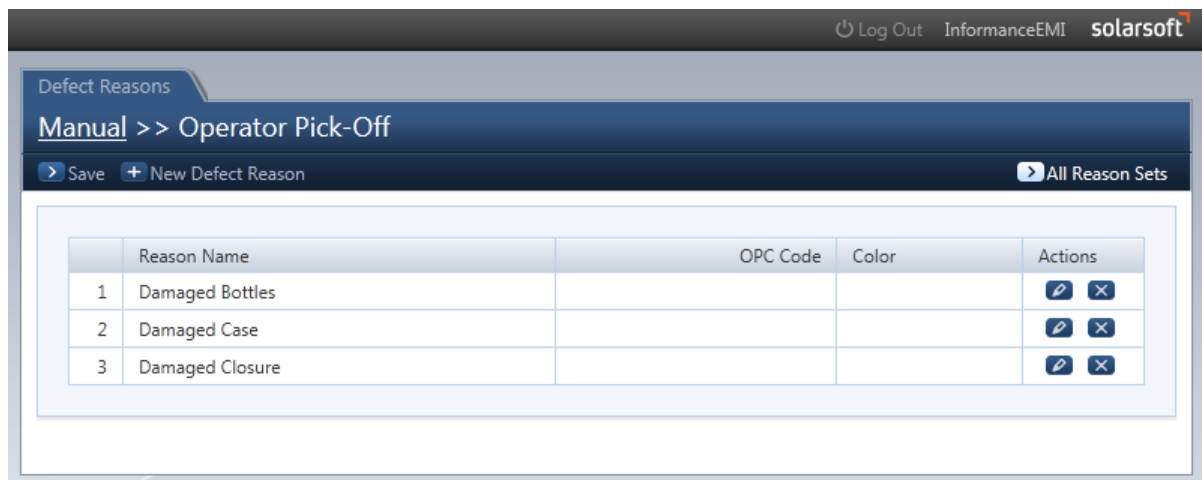

Figure 30: Defect Subreason List

Adding a New Defect Reason / Subreason

As described above, each Reason Set is structured as two-level hierarchy of defect reasons. The *New Defect Reason* button () in the upper right corner of the tab allows you to add a reason to the currently displayed level in the hierarchy. So before adding a new defect reason or subreason, you must first drill-in to the reason set and display the level where this new reason should be placed.

For example, to add a subreason to the 'Operator Pick-Off' reason, that list of subreasons must first be displayed by clicking on the reason set and then the 'Operator Pick-Off' reason.

Upon clicking the *New Defect Reason* button ( *New Defect Reason*) in the upper right corner, the New Reason dialog box will appear. At a minimum, you must enter the name for this new defect reason in the *Reason* box provided. Remember that reasons and subreasons cannot exceed 20 characters in length.

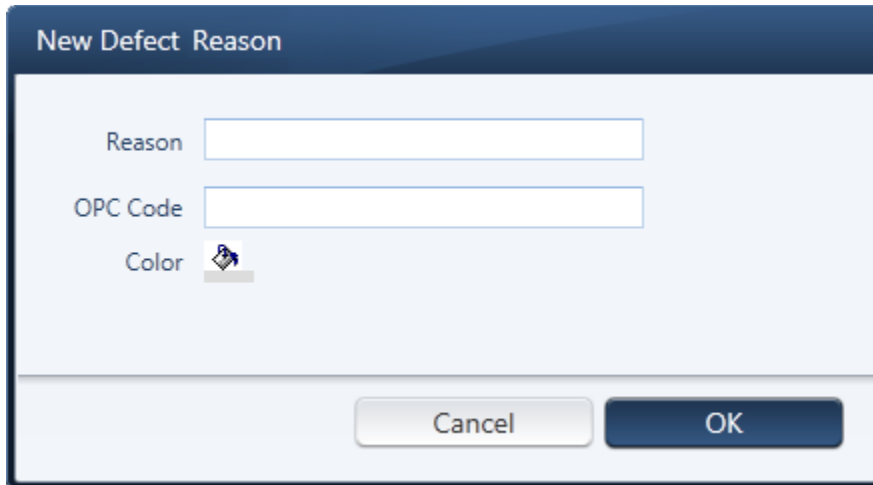

The image shows a dialog box titled "New Defect Reason". It has a dark blue header bar with the title in white. Below the header, there are three input fields: "Reason" (a text box), "OPC Code" (a text box), and "Color" (a color selection icon). At the bottom of the dialog, there are two buttons: "Cancel" and "OK".

Figure 31: New Defect Reason Screen

The OPC Code is an optional field used to support automatic tagging of the defect reason from the asset's PLC or control system. In this field, enter the integer that the control system will use as an alias for this downtime reason. To assign multiple integer codes to this new reason, enter the codes as a comma-separated list (i.e. 2,4,15,138). If you will not be assigning an OPC Code, simply leave the field blank. Do not enter an OPC Code of 0 as it is a reserved value and will not be accepted.

You can assign a color to this reason which will be used in all charts and graphs in the Plant Reporting module. Any reason that does not have an explicit color assignment will be assigned a color from the default palette based on its order of precedence in that specific chart. So without a specific color assignment, the Plant Reporting module will most likely assign a different color to the reason from day to day and chart to chart. To assign a color to your new reason, click on the paint bucket then select a color from the pop-up color palette.

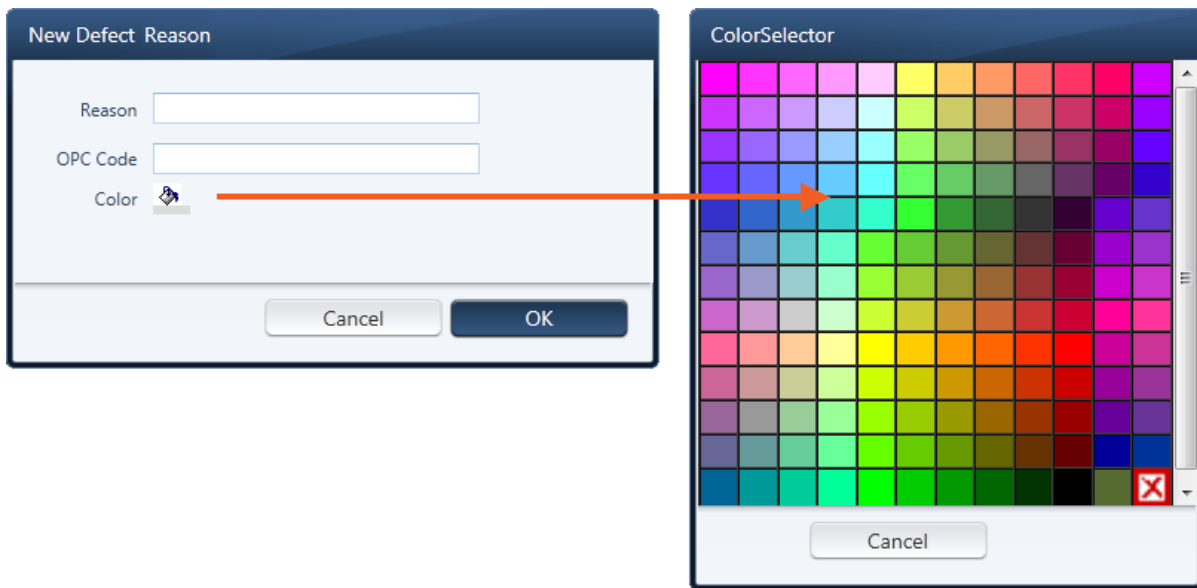

Figure 32: Defect Reason Color Selection

To assign a color, click on the paint bucket then select a color from the pop-up color palette.

After completing the *New Reason* dialog, click the **OK** button at the bottom to close it. Your new reason will now appear in the displayed list. However, IT IS NOT YET SAVED. You must click the **Save** button ( **Save**) in the upper left corner to save your new entry into the reason set. If you log out of System Administration or close your web browser without clicking save first, your entry will be lost. If you try to navigate to another tab without saving changes, you will be prompted to save first.

Editing an Existing Defect Reason / Subreason

To edit the name, OPC Codes or Color of an existing reason, click the edit button (✎) for that reason in the far right column of the list. The Edit dialog box will appear with the current settings populated in each field.

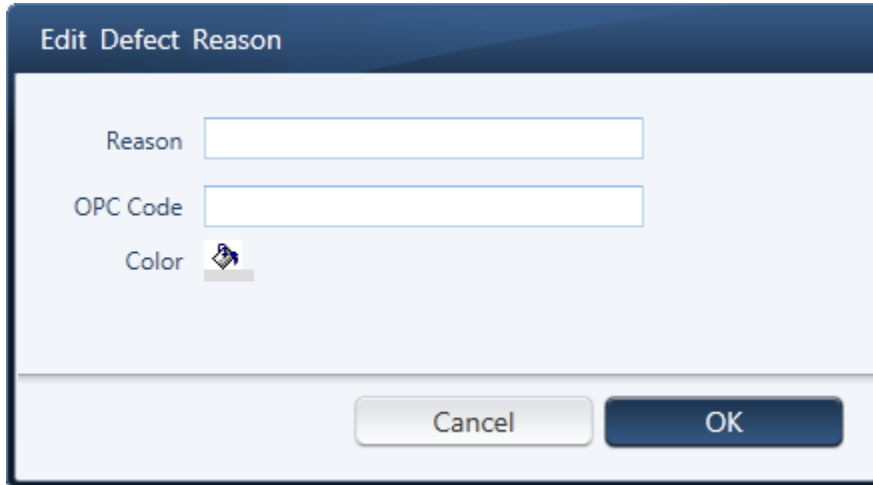

Figure 33: Edit Defect Reason Screen

Simply edit the fields as needed and click OK to close the edit dialog box. The same rules and restrictions mentioned above for creating a *New Reason* also apply when editing a reason:

Reasons cannot exceed 20 characters

The OPC Code and Color fields are optional and the OPC Code must be an integer greater than 0. If you need to assign multiple OPC Codes, enter them as a comma-separated list (i.e. 2, 4, 5, 6, 23).

You must click the Save button (➤ Save) after editing a reason in order for your changes to be saved

Deleting an Existing Defect Reason / Subreason

To remove a reason, click the delete button (✕) beside the reason in the far right column. After clicking delete, the entry will immediately be removed from the displayed list. You must confirm your deletions by clicking the Save button (➤ Save) in the upper left corner. If you close your browser or log out without saving, your deletions will be restored.

Additional Fields

Additional field sets, regardless of their name and meaning within your system, are modeled after the User sets described in the Users section of the document. Additional field sets contain flat lists of entries, not hierarchies, and each entry has properties of name, description and OPC code.

The procedures described in the Users section for adding, editing and deleting entries in a User set will also apply to any additional field set. Please refer to the Users section for guidance in managing your additional fields.

Configuration Features

As discussed in the opening section of this user guide, the System Administration interface contains additional *Configuration Features* that are used by the installing engineer to define the basic elements of your Informance system. Following installation, these settings are rarely adjusted and therefore they are not included in the standard customer administration role.

In Plant administration, these configuration features include a *DCE* tab used to define new assets in the plant and assign their tagging fields and shift schedule. They also include a *Super Reasons* tab used to define the list of Super Reasons as well as a *Units* tab where the different unit sets are defined. Again, it is strongly recommended that you assign any new users to the customer role that has been configured and not provide anyone these full administrative privileges. Improper adjustments to these settings could have serious consequences for your Informance system.

Data Management Console

The System Administration site also provides tools for changing Informance data that may have been incorrectly recorded due to a system issue or user error. These tools are found within the **Data Management Console** tab which can be hidden for all but the top level administrative roles if necessary.

The screenshot shows the Informance Data Console interface. The main area displays a table of production lines with columns for Line, Shift, Date/Time, SKU, User, Event Length, Cycles, Defects, Reason, Subreason, Subreason1, Subreason2, Batch, and Notes. A summary section at the bottom shows totals for Prior Time, Edited Time, Start, Defective, and Finished units. A notification section at the bottom lists three data selection rules.

Line	Shift	Date/Time	SKU	User	Event Length	Cycles	Defects	Reason	Subreason	Subreason1	Subreason2	Batch	Notes
Work Center 1	1	3/8/2010	64oz Brand A	Arthur	N/A	N/A	42	Operator Pick-Off	Damaged Bottles			83647	
Work Center 1	1	3/8/2010	64oz Brand A	Arthur	N/A	N/A	16	Operator Pick-Off	Damaged Case			83647	
Work Center 1	1	3/8/2010	64oz Brand A	Arthur	N/A	N/A	24	Operator Pick-Off	Damaged Closure			83647	
Work Center 1	1	3/8/2010 6:00:00 AM	64oz Brand A	Arthur	00:05:15	0	N/A	Start/End of Shift				83646	
Work Center 1	1	3/8/2010 6:05:15 AM	64oz Brand A	Arthur	00:13:28	656	N/A	Uptime				83646	
Work Center 1	1	3/8/2010 6:18:43 AM	64oz Brand A	Arthur	00:01:36	0	N/A	Filler	Bottle Jam			83646	
Work Center 1	1	3/8/2010 6:20:19 AM	64oz Brand A	Arthur	00:14:24	702	N/A	Uptime				83646	
Work Center 1	1	3/8/2010 6:34:43 AM	64oz Brand A	Arthur	00:01:44	0	N/A	Labeler	Bottle Jam			83646	
Work Center 1	1	3/8/2010 6:36:27 AM	64oz Brand A	Arthur	00:02:08	104	N/A	Uptime				83646	
Work Center 1	1	3/8/2010 6:38:35 AM	64oz Brand A	Arthur	00:00:48	0	N/A	Capper	Cap Jam in Chute			83646	
Work Center 1	1	3/8/2010 6:39:23 AM	64oz Brand A	Arthur	00:05:48	331	N/A	Uptime				83646	

TOTALS: Prior Time: 168:00:00 Edited Time: 168:00:00 Start: 275,571.00 units Defective: 3,080.00 units Finished: 272,491.00 units

Data Selection | Notifications |

- 21 SKU Entries are less than 20 Hour(s) in duration. [Select](#)
- 1 Defect entries are not associated with any production (uptime) entries. [Select](#)
- 751 Uptime Entries for All Assets have more than 50 cycles/hour. [Select](#)

Figure 34: The Data Console Tab

Important - Visibility of the Data Console tab, like all other tabs, is controlled by Informance's role-based security system. Logins that have been assigned the appropriate administrative role within the system will have access to this tab. For all other logins, this tab will be hidden.

This chapter begins with an overview of the Data Management Console (DMC) to explain the layout and navigation of the DMC interface. The basics of data selection are also covered within that section.

The next section provides detailed instructions for the three major data change actions: Split, Combine and Replace. You will also learn how to click within the editable cells of the data grid to change counts and other values for a specific event.

The final section of this chapter explains how the DMC validates your changes and notifies you if your actions violate the rules and constraints of the Informance data model. For example, if your changes result in more than 24 hours of total event time for a single day, the notification window will alert you to this mistake and guide you to the specific records that need to be corrected.

The DMC Environment

The user interface for the Data Management Console (DMC) is organized into 3 sections: the data selection interface at the top, the event grid in the middle and the notification window at the bottom.

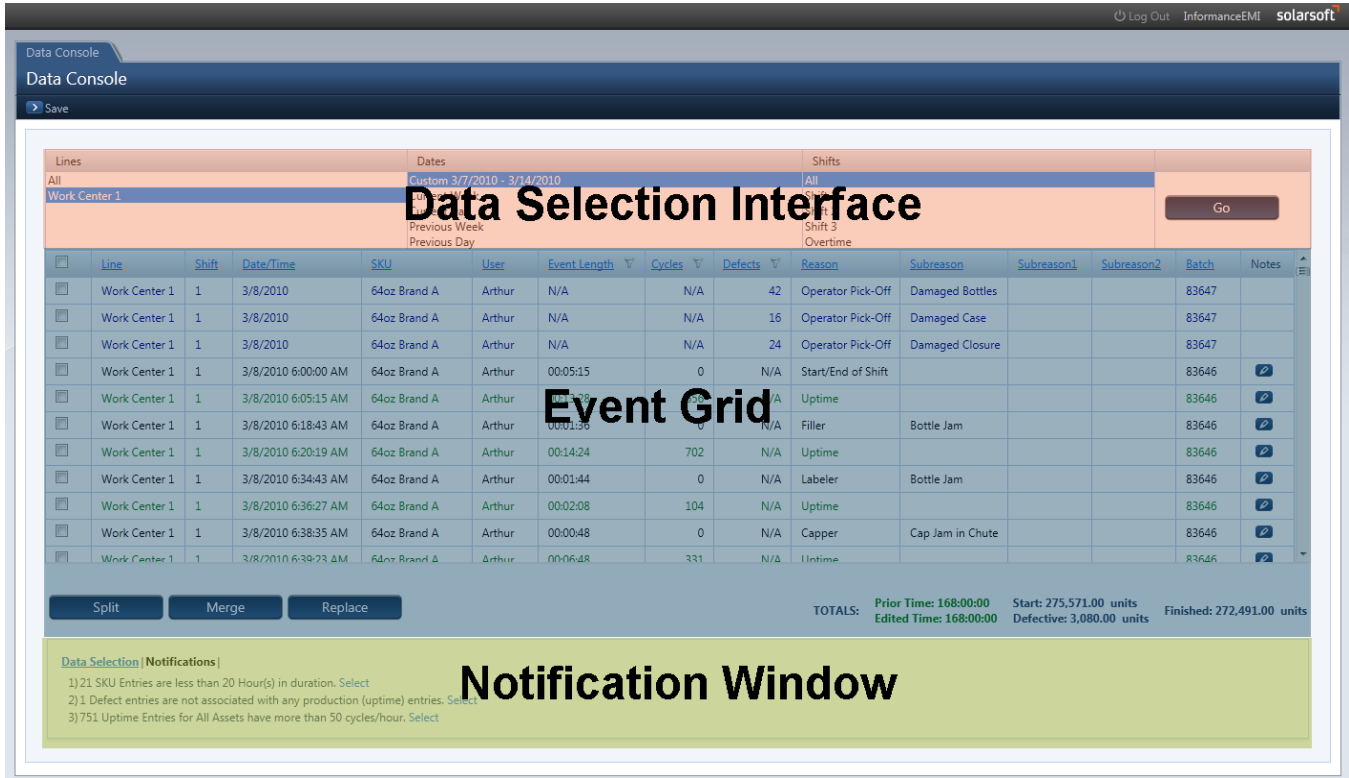

Figure 35: The Three Sections of the Data Management Console User Interface

The **data selection interface** has three selection windows: Lines (i.e. Production Assets), Dates and Shifts which are organized from left to right across the top of the screen. After using these windows to form a data selection, press the **GO** button in the upper right corner to populate the event grid below with your selected data.

Figure 36: DMC Data Selection Interface

The **event grid** is initially blank when the DMC interface first loads but is populated with events after making a data selection above and clicking the GO button. The event grid is updated whenever your data selection is changed and the GO button is pressed again.

The first column of the data grid contains a checkbox for each event which is used to select that event for editing. Any action you initiate (i.e. Split, Combine, Replace) will only be performed on

those events that have been checked. Clicking the checkbox in the header row will check all events in your data selection.

By default, events within the grid are sorted in ascending order by Line, Shift and Date/Time. To sort the events differently, simply click on a different column heading. Click the heading once for ascending order or a second time for descending order. An up or down arrow will appear next to the column header to confirm that events are now sorted by that column in either ascending or descending order, respectively. For example, if you wish to sort all of the events according to their duration, click the **Event Length** column heading and the shortest events will be listed first (ascending). Click it again and the longest events will be listed first (descending).

The event grid also allows you to place additional filters on the data based on Event Length, Cycles or Defects. For example, you may need to adjust a cycle count that is too high for one of your uptime events. In order to easily locate these events, you can hide all events that have few cycles by applying a filter. Click the filter icon () next to the Cycles column headings to apply a filter. A pop-up window will appear to prompt you for the filter parameters.

Tip. When a filter has been applied, a black box will appear around the filter icon for that column to indicate that some records have been filtered out.

At the bottom left corner of the event grid section you will find the Split, Combine and Replace buttons which are used to initiate any of the three primary editing actions on events that have been checked. In the lower right corner you will find some key summary statistics about your data:

- **Prior Time** - This is the total time of the events you selected before any edits were made.
- **Edited Time** - This is the total time of the events based on all un-saved edits.
- **Start** - This is the sum of cycles from all uptime records in your data selection. This value will update automatically whenever a cycle value is changed.
- **Defective** - This is the sum of defects from all defect records in your data selection. This value will update automatically whenever a cycle value is changed.
- **Finished** - This is simply the subtraction of the defective count from the start count.

Important - The start, defective and finished counts will be shown in 'Cases' only if there is a 'Cases' unit associated with every SKU found in the data selection. If one or more events in the data selection are tagged to a SKU which does not have an associated 'Cases' unit, then the counts will be presented in terms of start sensor units and the count will be labeled as 'units'.

Line	Shift	Date/Time	SKU	User	Event Length	Cycles	Defects	Reason	Subreason	Subreason1	Subreason2	Batch	Notes
Work Center 1	1	3/8/2010	64oz Brand A	Arthur	N/A	N/A	42	Operator Pick-Off	Damaged Bottles			83647	
Work Center 1	1	3/8/2010	64oz Brand A	Arthur	N/A	N/A	16	Operator Pick-Off	Damaged Case			83647	
Work Center 1	1	3/8/2010	64oz Brand A	Arthur	N/A	N/A	24	Operator Pick-Off	Damaged Closure			83647	
Work Center 1	1	3/8/2010 6:00:00 AM	64oz Brand A	Arthur	00:05:15	0	N/A	Start/End of Shift				83646	
Work Center 1	1	3/8/2010 6:05:15 AM	64oz Brand A	Arthur	00:13:28	656	N/A	Uptime				83646	
Work Center 1	1	3/8/2010 6:18:43 AM	64oz Brand A	Arthur	00:01:36	0	N/A	Filler	Bottle Jam			83646	
Work Center 1	1	3/8/2010 6:20:19 AM	64oz Brand A	Arthur	00:14:24	702	N/A	Uptime				83646	

TOTALS: Prior Time: 168:00:00 Edited Time: 168:00:00 Start: 275,571.00 units Defective: 3,080.00 units Finished: 272,491.00 units

Figure 37: The Event Grid of the DMC user interface.

The **notifications window** at the bottom of the interface will initially be empty when the Data Management Console is first loaded. Messages will appear here following an edit or save if the DMC detects problems with the changes you have attempted. Some notifications may be informative only while others may be errors that require action in order for your changes to be saved. In the case of an error the notification may be followed by a **Select** hyperlink which you can click to have the DMC automatically check the events that need to be corrected.

Also within the notification window is a **Data Selection** hyperlink which you can click to verify the parameters of your data selection. After reviewing the parameters of your data selection, click the **Notifications** link to bring the notification messages back to the foreground.

[Data Selection](#) | [Notifications](#) |

Figure 38: Examples of the DMC’s Notification and Data Selection Section

Data Selection

Before editing any data with the Data Management Console, you first need to select a series of events using the data selection interface at the top of the screen. Start on the left by selecting the Line(s) (i.e. Production Assets). You can select all lines by simply clicking on the 'All' listing at the top. To select a single line, scroll down and find it in the list and click it. For multiple selections, hold down the CTRL key on your keyboard while clicking each line name that you wish to select.

Lines	Dates	Shifts	
All	Custom 3/7/2010 - 3/14/2010	All	Go
Work Center 1	Current Week	Shift 1	
	Current Day	Shift 2	
	Previous Week	Shift 3	
	Previous Day	Overtime	

Within the **Dates** window, define the date range for your data selection. You can click **Custom** to manually define the start and end dates with the pop-up calendar tool or you can choose from one of the four pre-defined ranges: Current Week, Current Day, Previous Week or Previous Day.

Tip. The Informance 'Week' begins on Sunday and ends on Saturday. So when selecting 'Current Week' your data selection will include all events from the previous Sunday through today. When selecting 'Previous Week', your data selection will include all events starting two Sundays ago through the previous Saturday.

Lastly, use the **Shifts** window to select the shifts to include within your date range. Similar to the Line selection, you have the option to choose **All** or to select individual shifts while holding the CTRL key on your keyboard.

After you have defined the Lines, Dates and Shifts, click the **GO** button in the upper right corner to complete your data selection. Your selected events will be presented in the event grid below for editing.

Important - Be aware that performance of the Data Management Console can decline with very large data selections. Therefore, if your date range is large (one week or more), try to select fewer Lines. Alternatively, select only a few days and edit those events first. Then select a few more days and so on.

Editing Data

Once you have selected a series of events, there are three primary editing actions that can be initiated using the buttons in the lower left corner:

- **Split** - The splitting of one uptime or downtime event into two separate events and assigning unique tags and values to each.
- **Combine** - Combining two or more uptime or downtime events into a single event and defining the tags and values for the consolidated record.
- **Replace** - Selecting multiple uptime, downtime and/or defect records and globally replacing one or more tags.

In addition to these three actions, you may also edit individual values for a single record within the event grid itself. This will allow you to change a single tag for an event or adjust the cycle and defect counts. In addition, you can add or edit notes for a single record within the event grid.

Before initiating any of these actions, you must check the event(s) to be edited using the checkboxes in the first (left) column of the grid. To select all events, check the box in the header row of the grid. Also be aware that your edits are not committed to the database until you click the **Save** button in the upper right corner of the screen.

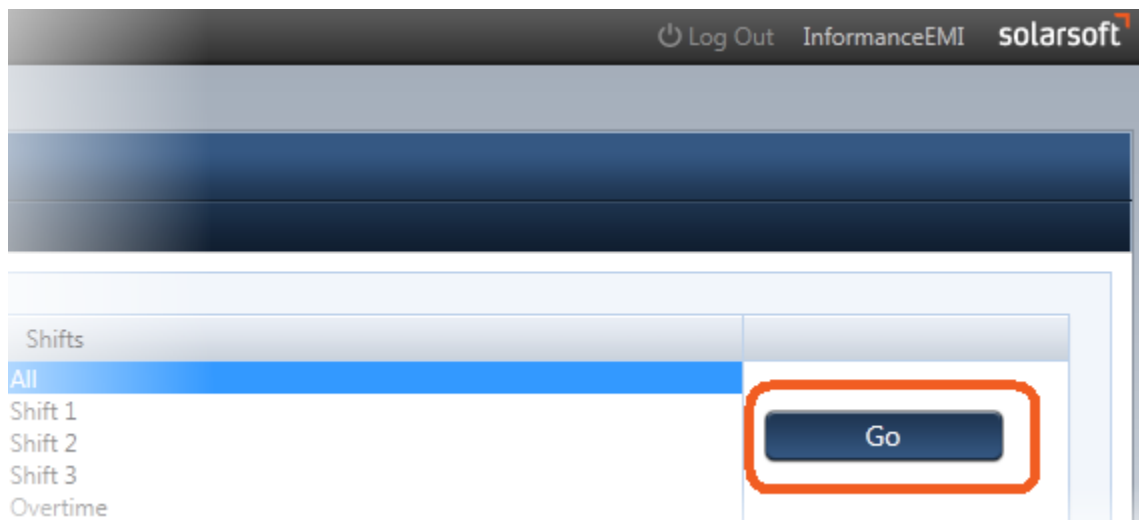

Figure 39: Event Data Selection Go Button

Splitting Data

To split an event, check the box for the event you wish to split and then click the **Split** button in the lower left corner just below the grid. The **Split Event** window will appear.

The screenshot shows a 'Split Event' dialog box with a table of fields for two events. The 'Cycles' field is currently unchecked. The 'Duration' field is checked, and the 'Batch' field is also checked. The 'Original' values are shown above the input fields for each event.

	Event 1	Event 2
<input type="checkbox"/> Cycles	Original 0 0	0
<input checked="" type="checkbox"/> Duration	Original 00:01:44 00:1:00	00:00:44
<input type="checkbox"/> SKU	64oz Brand A	64oz Brand A
<input type="checkbox"/> User	Arthur	Arthur
<input type="checkbox"/> Downtime Reason	Labeler	Labeler
<input type="checkbox"/> Downtime SubReason	Bottle Jam	Bottle Jam
<input type="checkbox"/> Downtime SubReason1	No Subreason	No Subreason
<input type="checkbox"/> Downtime SubReason2	No Subreason	No Subreason
<input type="checkbox"/> Defect Reason	No Reason	No Reason
<input type="checkbox"/> Defect SubReason	No Subreason	No Subreason
<input checked="" type="checkbox"/> Batch	83646	83646

Buttons: Cancel, OK

Figure 40: The Split Event Window

The split event window is organized with a column for each of the two events that will be created by the split. The columns are labeled 'Event 1' and 'Event 2' to indicate the chronological order in which they will be saved. Each row represents a different value or tag that can be edited for either event.

The **cycles** value will only be applicable if you are splitting an uptime event. The original cycles total will be shown above the row to help you assure that the cycles you enter for each event will sum to match the original.

The **duration** values must also be kept consistent with the original which is shown just above the row. Your split will not be saved if the total duration of the two events does not match the original.

To change SKU, User or any other event tags, first check the box to indicate you wish to change that tag for one or both events. Then use the drop-down box within either column to change the value.

Once you have set the values for both events, click the **OK** button in the lower right corner to close the Split Event window. In the event grid you will see that your two new events have replaced the original. To commit these changes to the database, click the **Save** button in the upper left corner of the DMC interface.

Merging Data

To merge two or more events into a single event, check a consecutive series of uptime and/or downtime events then click the **Merge** button in the lower left corner. The **Merge Events** window will appear.

- Waiting on ...
- No Reason

Cancel OK

Figure 41: The Merge Events window

The Merge Events window provides a single column for the new event that will be created and a row for each tag value that will be assigned to the record. The cycles and duration values will be calculated for you automatically. For the SKU, User and other event tags, first check the box for each tag you wish to adjust then use the drop-down boxes to make your selections.

After completing the tags for your new event, click the **OK** button to close the Merge Events window and return to the event grid. You will find that your selected events have been removed and replaced by the new event. To commit this change to the database, click the **Save** button in the upper left corner of the DMC interface.

Replacing Data

To change or **replace** one or more tags on multiple uptime, downtime and/or defect events, first check the boxes for the events that need to be changed then click the **Replace** button in the lower left corner. The **Batch Replace** window will appear:

	Find	Change To
<input type="checkbox"/> SKU	None	None
<input checked="" type="checkbox"/> User	Alex	Arthur
<input type="checkbox"/> Downtime Reason	No Reason	No Reason
<input type="checkbox"/> Downtime SubReason	No Subreason	No Subreason
<input type="checkbox"/> Downtime SubReason1	No Subreason	No Subreason
<input type="checkbox"/> Downtime SubReason2	No Subreason	No Subreason
<input type="checkbox"/> Defect Reason	No Reason	No Reason
<input type="checkbox"/> Defect SubReason	No Subreason	No Subreason
<input type="checkbox"/> Batch		

Buttons: Cancel, OK

Figure 42: The Batch Replace Window

The batch replace window is organized into two columns labeled Find and Change To. In the find column, specify the tags that the DMC should search for within the checked event records. Once found, the DMC will replace those tags with the corresponding values you have specified in the Change To column.

After defining all of your replacements, click the **OK** button in the lower right corner to close the Batch Replace window and return to the event grid. Your replacement tags should now appear within all of the selected events. To commit these changes to the database, click the **Save** button in the upper left corner of the DMC interface.

Editing Within the Grid

To make a change to specific value within a single event, first check the checkbox for the event you wish to edit and then click anywhere within that event's row. Each value that can be changed will become editable either in the form of a text box or drop-down selection. Cycles, for example, will appear within a text box that you can directly click in to type a new value. The SKU, User and other event tags will be editable as a drop-down selection.

<input type="checkbox"/>	Line	Shift	Date/Time	SKU	User	Event Length	Reason	Subreason	Batch	Notes
<input checked="" type="checkbox"/>	Work Center 1	2	3/8/2010 2:26:16 PM	64oz Brand B	Ann	00:00:40	Filler	Bottle Jam	83644	
<input type="checkbox"/>	Work Center 1	2	3/8/2010 2:26:56 PM	64oz Brand B	Ann	00:13:28	Uptime		83644	

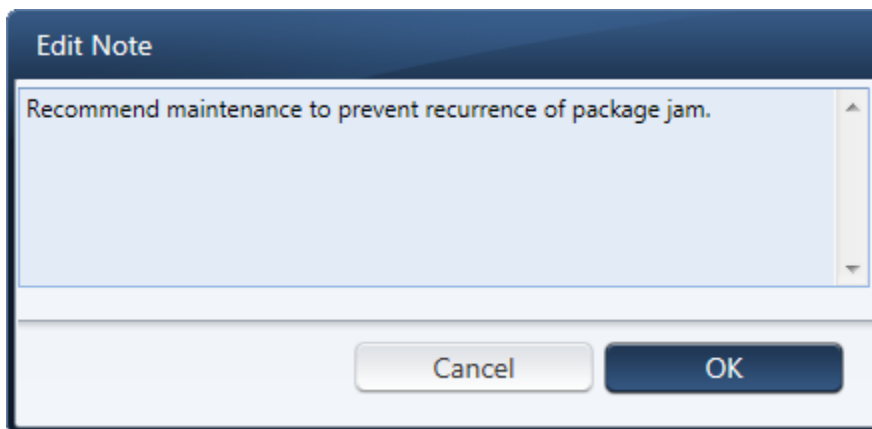

Figure 43: Editing Events within the Grid

Again, after making the changes on screen, you will need to click the **Save** button in the upper left corner to commit your changes to the database.

Adding and Updating Notes

You can add a note to an event by clicking the Note icon () on the far right side of the Event you wish to add the note to.

In the Edit Note window, enter or update the note text.

The image shows a dialog box titled "Edit Note". It contains a text area with the text "Recommend maintenance to prevent recurrence of package jam." Below the text area are two buttons: "Cancel" and "OK".

Figure 44: Edit Note Window

After entering or updating the note, click the **OK** button in the lower right corner to close the Edit Note window and return to the event grid. To commit these changes to the database, click the **Save** button in the upper left corner of the DMC interface.

Notifications and Validation

Some changes that you attempt to make may violate certain constraints or rules of the Informance application or database scheme. For this reason, the Data Management Console will first review and validate all of your changes when you click the **Save** button in the upper right corner. If any such violations are found, you will be notified in the window at the bottom of the interface and your changes will not be committed to the database.

Figure 45: Two Examples of the Notifications Section of the DMC Interface

Tip. By default the notification will be in the foreground as you see on the left. On the right the data selection has been clicked and is in the foreground.

Some notifications may just be informational and not require any action. For example, if your changes result in a certain SKU only being tagged to a single 30 second downtime event, the DMC will notify you of this as it expects SKUs to be active for several minutes or hours at a time.

Any notification that requires action to correct will be followed by a **Select** or **Edit** hyperlink which you can click to be taken directly to the events within the grid that need to be corrected.

The notifications window can also be a convenient place to confirm your current data selection. When clicking the **Data Selection** link the data selection will move to the foreground. Although this will usually match what you see in the data selection windows above, it is often more readable here especially if your system has multiple Lines (datasets) that require scrolling in the windows above.
